Cognitively Diagnostic Assessment:

Cognitive Diagnostic Assessment for Education Jacqueline Leighton,Mark Gierl,2007-05-14 With the current push toward educational reform there is great potential for innovation and change particularly in large scale testing One area where change is possible is in cognitive diagnostic assessment Researchers in educational measurement and cognitive psychology are finally in a position to design tests targeted specifically for providing valuable information about students cognitive strengths and weaknesses This self contained volume organizes what is known about cognitive diagnostic assessment in education including its conceptual and philosophical basis methods and applications The complete list of topics includes educational demand philosophical rationale construct validity cognitive methods test construction statistical models and unresolved issues e g how to best translate diagnostic information into teaching practices Leighton and Gierl present a comprehensive and up to date examination of cognitive diagnostic assessment in education *Cognitively Diagnostic Assessment* Paul D. Nichols,Susan F. Chipman,Robert L. Brennan,1995 First Published in 1995 Routledge is an imprint of Taylor Francis an informa company Cognitive Diagnostic Assessment for Learning Peida Zhan,Feiming Li,Hong Jiao,2022-01-19 **Effective Cognitive Diagnostic Assessment with Computerized Adaptive Testing** Teck Yong Lawrence Neo,2011 Educators are seeking out mechanisms for reporting diagnostic information about the strengths and weaknesses of each student Cognitive diagnostic assessment CDA is a form of assessment that could facilitate the educators in discovering their students strengths and weaknesses In CDA the examinees are classified according to the specific attributes ability skills and knowledge that the examinees possess There are numerous models for cognitive diagnostic assessment A higher order latent trait model was used in the study This model takes into account the local dependencies of the attributes by using a higher order latent trait to model the mastery of the attributes Another benefit for using a higher order latent trait model is that it allows for concurrent estimation of the examinees higher order latent trait as well as his or her mastery of the attributes Equipping educators with reports on individual examinee s general ability together with his or her mastery states with respect to the attributes could lead to better tailored remediation For example more scaffolding might need to be provided to examinees with lower general ability whereas those with higher general ability might require a different pedagogical approach Computerized adaptive testing CAT is a mode of testing that has gained popularity in recent years due to its advantages It tailors the test according to the examinees ability that is each examinee will receive items that are neither too easy nor too difficult Consequently CAT is a more efficient test mode compared to paper and pencil testing With the advancement of technology CAT became a viable option for test administration The advantages that CAT have over paper and pencil testing make it an attractive option of administering CDA The key to adaptive testing is the item selection rules The item selection rules should be able to pick the item that closely matches the examinee s ability Most CATs are based on item response theory IRT models These IRT based CAT and CDA adopt different evaluation framework for the

examinees which implies that IRT based CAT methods cannot be directly applied for administration of CDA Thus new methods must be developed for a cognitive diagnostic computerized adaptive testing CD CAT The efficiency of adaptive testing is known to be highly dependent on the ability of the item selection rules to pick the most appropriate item for the examinee at every stage of the testing However problems might arise if the most appropriate items are selected at every stage without consideration for non statistical constraints like item exposure rate and content balancing In practical situations tests usually cover several content areas and have balanced content coverage Thus content balancing constraints are important for test construction In addition items that are known to many examinees could lose their powers for distinguishing examinees in terms of their abilities Examinees with low ability might be able to answer these over exposed items correctly because they could prepare the answers to these items beforehand In short for an item selection rule to have practical applications it should be able to handle non statistical constraints as well Thus the focus of this study is on item selection rules with mechanism for managing non statistical constraints This study examines the efficiency of two new item selection rules A higher order latent trait model was used for the study Besides being able to account for the local dependencies between the attributes the model also allows for simultaneous estimations of the examinee s mastery state with respect to specific attributes and his or her higher order latent trait Providing educators with reports on individual examinee s general ability a higher order latent trait together with his or her mastery states with respect to the attributes could lead to better tailored remediations For example more scaffolding might need to be provided to examinees with lower general ability whereas those with higher general ability might require a different pedagogical approach Two new item selection rules VAS and SHAS which are based on attribute specific item discrimination index are proposed in chapter 2 The study suggests that the adapted Hybrid Kullback Leibler index and the adapted versions of the new indices A_VAS and A_SHAS are be better suited for providing diagnostic feedback if a short test is used These three adapted indices were able to recover the individual attributes with high degrees of accuracy After 24 items had been administered the three indices had correctly classified examinees classification matching their latent classes about 73% of the examinees while about 87% of examinees were classified correctly or almost correctly examinees with at least seven out of eight attributes correctly classified In terms of the accuracy in the general ability estimation the three indices had produced a high level of bias and mean square errors A longer test would be needed to obtain more accurate estimation of the general ability Cognitive Assessment Kikumi K. Tatsuoka,2009-05-22 This book introduces a new methodology for the analysis of test results Free from ambiguous interpretations the results truly demonstrate an individual s progress The methodology is ideal for highlighting patterns derived from test scores used in evaluating progress Dr Tatsuoka introduces readers to the Rule Space Method RSM a technique that transforms unobservable knowledge and skill variables into observable and measurable attributes RSM converts item response patterns into attribute mastery probabilities RSM is the only up to date methodology that can handle

large scale assessment for tests such as the SAT and PSAT PSAT used the results from this methodology to create cognitively diagnostic scoring reports In this capacity RSM helps teachers understand what scores mean by helping them ascertain an individual s cognitive strengths and weaknesses For example two students may have the exact same score but for different reasons One student might excel at processing grammatically complex texts but miss the main idea of the prose while another excels at understanding the global message Such knowledge helps teachers customize a student s education to his or her cognitive abilities RSM is also used for medical diagnoses genetics research and to help classify music into various states of emotions for treating mental problems The book opens with an overview of cognitive assessment research and nonparametric and parametric person fit statistics The Q matrix theory is then introduced followed by the Rule Space method Various properties of attribute mastery probabilities are then introduced along with the reliability theory of attributes and its connection to classical and item response theory The book concludes with a discussion of how the construct validity of a test can be clarified with the Rule Space method Intended for researchers and graduate students in quantitative educational and cognitive psychology this book also appeals to those in computer science neuroscience medicine and mathematics The book is appropriate for advanced courses on cognometrics latent class structures and advanced psychometrics as well as statistical pattern recognition and classification courses taught in statistics and or math departments *The Wiley Handbook of Cognition and Assessment* Andre A. Diagnostic Measurement André A. Rupp,Jonathan Templin,Robert A. Henson,2010-04-10 This book provides a comprehensive introduction to the theory and practice of diagnostic classification models DCMs which are useful for statistically driven diagnostic decision making DCMs can be employed in a wide range of disciplines including educational assessment and clinical psychology For the first time in a single volume the authors present the key conceptual underpinnings and methodological foundations for applying these models in practice Specifically they discuss a unified

approach to DCMs the mathematical structure of DCMs and their relationship to other latent variable models and the implementation and estimation of DCMs using Mplus The book s highly accessible language real world applications numerous examples and clearly annotated equations will encourage professionals and students to explore the utility and statistical properties of DCMs in their own projects The companion website www guilford com rupp materials features chapter exercises with answers data sets Mplus syntax code and output Winner Award for Significant Contribution to Educational Measurement and Research Methodology AERA Division D **Maximizing the Potential of Multiple-Choice Items for Cognitive Diagnostic Assessment** Zhimei Gu,2011 When applying cognitive diagnostic models the goal is to accurately estimate students diagnostic profiles The accuracy of these estimates may be enhanced by looking at the types of incorrect options a student selects This thesis research examines the additional diagnostic information available from the distractors in multiple choice items used in large scale achievement assessments and identifies optimal conditions for extracting diagnostic information The study is based on the analyses of both real student responses and simulated data The real student responses are from a large scale provincial math assessment for grade 6 students in Ontario Data were then simulated under different skill dimensionality and item discrimination conditions Comparisons were made between student profile estimates when using the DINA and MC DINA models The MC DINA model is a newly developed cognitive diagnostic model where the probability of a student choosing a particular item option depends on how closely the student s cognitive skill profile matches the skills tapped by that option The results from the simulation data analysis suggested that when the simulated data included additional diagnostic information in the distractors the MC DINA model was able to use that information to improve the estimation of the student profiles which shows the utility of the additional information obtained from item distractors The value of adding information from distractors was greater when there was lower item discrimination and more skill multidimensionality However in the real data the keyed options provided more diagnostic information than the distractors and there was little information in the distractors that could be utilized by the MC DINA model This implies that current math test items could be further developed to include diagnostically rich distractors The study offers some suggestions for a design of multiple choice test items and its formative use The Learning Sciences in Educational Assessment Jacqueline P. Leighton,Mark J. Gierl,2011-06-13 There is mounting hope in the United States that federal legislation in the form of No Child Left Behind will improve educational outcomes As titanic as the challenge appears to be however the solution could be at our fingertips This volume identifies visual types of cognitive models in reading science and mathematics for researchers test developers school administrators policy makers and teachers In the process of identifying these cognitive models the book also explores methodological or translation issues to consider as decisions are made about how to generate psychologically informative and psychometrically viable large scale assessments based on the learning sciences Initiatives to overhaul educational systems in disrepair may begin with national policies but the success of these

policies will hinge on how well stakeholders begin to rethink what is possible with a keystone of the educational system large scale assessment A Cognitive Task Analysis, with Implications for Designing a Simulation-based Performance Assessment ,1998 **Psychometric Principles in Student Assessment** ,2002 **Test Theory Reconceived** Robert J. Correcting Fallacies about Educational and Psychological Testing Richard P. Phelps,2009 Standardized testing is used for diagnosis selection and achievement measurement by individuals in many fields including psychology education employment and professional credentialing Its benefits are numerous substantial and scientifically proven However these benefits are not well articulated or well publicized In their technical communications measurement specialists are generally positive about the worth of standardized testing Meanwhile those who engage public debate such as journalists and certain special interest groups tend to be less scientifically informed and more negative about the value of testing The contributors to this volume contend that most criticisms ignore readily accessible scientific evidence and have the unfortunate effect of discrediting the entire testing enterprise Standardized testing bears the twin burden of controversy and complexity and is difficult for many to understand either dispassionately or technically In response to this reality Richard P Phelps and a team of well noted measurement specialists present this book as a platform where they describe the current state of public debate about testing across fields explain and refute the primary criticisms of testing acknowledge the limitations and undesirable consequences of testing provide suggestions for improving testing practices and present a vigorous defense of testing and practical vision for its promise and future Those who are charged with translating the science of testing into public information and policy including administrators social scientists test publishers professors and journalists who specialize in education and psychology should find a wealth of usable information here with which to balance the debate **Proceedings of the XIVth Triennial Congress of the International Ergonomics Association and 44th Annual Meeting of the Human Factors and Ergonomics Society** Human Factors and Ergonomics Society.
