**Biology of the Plant Bugs (Hemiptera: Miridae)** Alfred George Wheeler, 2001 Plant bugs Miridae the largest family of the Heteroptera or true bugs are globally important pests of crops such as alfalfa apple cocoa cotton sorghum and tea Some also are predators of crop pests and have been used successfully in biological control Certain omnivorous plant bugs have been considered both harmful pests and beneficial natural enemies of pests on the same crop depending on environmental conditions or the perspective of an observer As high yielding varieties that lack pest resistance are planted mirids are likely to become even more important crop pests They also threaten crops as insecticide resistance in the family increases and as the spread of transgenic crops alters their populations Predatory mirids are increasingly used as biocontrol agents especially of greenhouse pests such as thrips and whiteflies Mirids provide abundant opportunities for research on food webs intraguild predation and competition Recent worldwide activity in mirid systematics and biology testifies to increasing interest in plant bugs The first thorough review and synthesis of biological studies of mirids in more than 60 years **Biology of the Plant Bugs** will serve as the basic reference for anyone studying these insects as pests beneficial IPM predators or as models for ecological research
