

DYNAMICAL TRANSITION THEORY OF HEXAGONAL PATTERN FORMATIONS

TAYLAN SENGÜL

ABSTRACT. The main goal of this paper is to understand the formation of hexagonal patterns from the dynamical transition theory point of view. We consider the transitions from a steady state of an abstract nonlinear dissipative system. To shed light on the formation of mixed mode patterns such as the hexagonal pattern, we consider the case where the linearized operator of the system has two critical real eigenvalues, at a critical value λ_c of a control parameter λ with associated eigenmodes having a roll and rectangular pattern. By using center manifold reduction, we obtain the reduced equations of the system near the critical transition value λ_c . By a thorough analysis of these equations, we fully characterize all possible transition scenarios when the coefficients of the quadratic part of the reduced equations do not vanish. We consider three problems, two variants of the 2D Swift-Hohenberg equation and the 3D surface tension driven convection, to demonstrate that all the main theoretical results we obtain here are indeed realizable.

1. INTRODUCTION: MAIN ASSUMPTIONS AND RESULTS

Transition phenomena is throughout all nonlinear sciences [23, 16, 14]. It shapes many physical, biological and social systems through instabilities. The formation of patterns in such systems, whether it be coatings of animals [24], convection cells in fluid systems [1] or crime patterns in cities [35], is intrinsically related to the transitions taking place in those systems. One of the tools to understand and classify the transition behavior is the dynamic transition theory [23]. The current work is an attempt to combine this theory with certain aspects of pattern formations and relies on some of the previous work in this direction [10, 33, 34, 20].

1.1. The setting and the main assumptions. We are interested in the transitions of a steady state solution of a general nonlinear dissipative system [37] on a Hilbert space X

$$(1) \quad \frac{du}{dt} = L_\lambda u + G_\lambda(u), \quad t > 0$$

where $u : [0, \infty) \mapsto X$ is the unknown function and $\lambda \in \mathbb{R}^1$ is a parameter. Here $L_\lambda : X_1 \rightarrow X$ is a linear operator where X_1 is another
