Durable Resistance In Crops:

Durable Resistance in Crops F. Lamberti, J. M. Waller, N. A. Van der Graaff, 2012-12-06 Plant diseases and pests are a major constraint to agricultural production despite the various measures used to control them. Chemical control although often effective may pose environmental hazards and is relatively expensive especially in developing countries where it may be completely uneconomic. Control through genetically mediated resistance to diseases and pests is both cheap and environmentally safe and at present most diseases and pests of staple food crops are controlled through some form of resistance. One of the basic problems in the use of resistance is its frequent lack of durability very often a type of resistance is used that breaks down after a certain period. The temporary nature of this resistance due to the development of new strains of pest or pathogen able to overcome it has seriously hindered the improvement of the yield potential of many crops as a continuing effort is needed to replace old cultivars whose resistance has failed with new ones. Following Vanderplank's now classical publications 1963, 1968 which differentiated horizontal and vertical resistance studies on several host-parasite systems have shown that different types of resistance can be distinguished genetically and epidemiologically and on the ability of the pests or pathogens to adapt to them. A knowledge of how resistance operates at the population level has also opened up possibilities of managing relatively simple resistance types in such a way that a stable host-pathogen system can be produced with a minimum of crop loss.

Durability of Disease Resistance Th. Jacobs, Jan E. Parlevliet, 2012-02-02 From February 24-28 1992 an international symposium on Durability of Disease Resistance was held at the International Agricultural Centre in Wageningen, the Netherlands. The symposium organized by the Department of Plant Breeding of Wageningen Agricultural University and the Centre for Plant Breeding and Reproduction Research (CPRO-DLO) was part of the DGIS funded programme Durable Resistance in Developing Countries. Without any form of prevention or protection nearly all crops will be seriously or even severely damaged by a range of pathogens. In modern agriculture man has been able to control many if not most pathogens using: i) pesticides ii) phyto-sanitary methods such as control of seed and plant material in order to start a crop disease free iii) agronomic measures such as crop rotation iv) disease resistance or combinations of these measures. Over the years the use of pesticides has increased enormously and so did the problems associated with pesticide use such as environmental pollution and building of resistance and tolerance to these pesticides in the pathogens. The use of resistance too increased strongly over the years and here too problems arose.
