

bulk of the trigonometrical and mathematical work, and we find that officers with engineer training are best for this. Although modern technique has reduced the work of map making, modern mobility and, of course, the range of modern aircraft, have enormously increased the area of the earth's surface for which maps may be required. Improvements in plotting and map reproduction have made it possible for up-to-date maps to be issued on a pretty lavish scale. In no theater, unless extremely close to home, is it possible to operate nowadays without a large map reproduction

and distribution service involving large numbers of big modern lithograph and printing machines.

One other activity for which the engineers are responsible is movement control. Strictly speaking, of course, this is a non-engineer staff function, but we find that engineer officers, especially those with railway and docks experience, usefully fill a high proportion of movement control posts.

Also, the Army Postal Service has always been manned by the RE. This dates from the days when we ran the Signals.

Bacteriological Warfare

Translated and digested by the MILITARY REVIEW from an article by Major Ernst Wiesmann in "Allgemeine Schweizerische Militärschrift" (Switzerland) August 1942.

WHEN and if bacteria are employed as combat means in total warfare, man and his domestic animals or plants will suffer a fatal blow. To be suitable for military purposes, however, microbes must fulfill a large number of conditions. For this reason, the different types that can be used are few in number. The following requirements are the most important:

1. The microbes must be "raised" and kept in readiness in large quantities.

2. The requirement, "kept in readiness," includes a certain degree of ability to survive on the part of the microscopic forms of life, even under unfavorable conditions.

3. It must be possible to bring the active agent into contact with the enemy in the proper form.

4. The incubation period of the disease that is to be induced must be as short as possible.

5. Pathogenic ability must be as great as possible. That is, all infected persons, if possible, must be made sick.

6. The sickness produced must come to a crisis as speedily as possible and must not be chronic.

7. The sickness produced must be as hard as possible to diagnose and its producer must be hard to determine.

8. Wherever possible, artificial immunization must not be possible and the producer should not respond to any specific chemical therapy.

9. It must be possible to immunize one's own forces against the sickness.

These requirements would seem to indicate that the possibilities of employing bacteriological warfare are rather limited. For example, requirements 1, 3, and 5 prevent the employment of the poliomyelitis virus; point 4 rules out the employment of the rabies virus, with an incubation period of 3 months, or of the tuberculosis bacillus; point 5 eliminates all producers of children's diseases; point 6 rules out tuberculosis bacillus or the producers of leprosy; point 8 eliminates the smallpox, tetanus, or diphtheria bacilli.

An attempt has always been made to associate bacteriological warfare with gas warfare, from the standpoint of their nature and employment. There is, however, a considerable difference between gas and
