Cancer And Aging:

Cancer and Aging Martine Extermann, 2013 Outlining the complex interaction between the two phenomena Cancer is clearly an age related disease Recent research in both aging and cancer has demonstrated the complex interaction between the two phenomena This affects a wide spectrum of research and practice anywhere from basic research to health care organization Core examples of these close associations are addressed in this book Starting with basic research the first chapters cover cancer development mTOR inhibition senescent cells altering the tumor microenvironment and immune senescence affecting cancer vaccine response Taking into account the multidisciplinary of geriatric oncology several chapters focus on geriatric and oncologic aspects in patient assessment treatment options nursing and exercise programs The book is rounded off by a discussion on the impact of the metabolic syndrome illustrating the interactions between comorbidity and cancer and a chapter on frailty This book provides the reader with insights that will hopefully foster his or her reflection in their own research and practice to further the development of this most exciting field Given the aging of the population worldwide and the high prevalence of cancer it is essential reading not only for oncologists and geriatricians but for all health practitioners

Aging and Cancer F. F. Holmes, 2012-12-06 The life of a human being is finite and all humans age see Fries 1980 It is difficult to separate the effects of disease on organs and tissues from those expected of aging This is particularly true for vascular and degenerative processes for which there are no clear boundaries between aging and disease Morbidity and mortality from heart disease and stroke are probably due both to disease and to changes of aging For cancer the second leading cause of death in America the situation is quite different cancer is clearly a disease and is not a change expected with aging Cancer incidence increases almost logarithmically after age 40 In the United States about one half of all cases of cancer are diagnosed after age 65 although those over 65 comprise less than one eighth of the population Thus cancer is very much a disease of the elderly There are at least two reasons for this first the prolonged exposure to cancer inducing agents and second the waning power of immune defenses against cancer

Cancer and Aging Bo Nordenskjold, Alvaro Macieira-Coelho, 2022-02-04 First published in 1990 The book examines the relationship between age and the development of cancer from different angles with a comprehensive approach that has not been used previously The multiple pathways at the cellular and tissue levels that can lead to a neoplastic growth are described in detail explaining the variable delay between cancer initiation and the clinical manifestations The time that elapses between exposure to the carcinogen and the clinical incidence of different neoplasiae is exemplified through a review of epidemiological studies with atomic bomb survivors and environment related cancers The developmental phenomena and the genetic determinants that may lead to or retard the progression of cancer through the life span of the organism are emphasized illustrating the very dynamic processes that involve neoplastic growth where new variables are continuously created

particularly for cancer science Lack of progress in curing majority of chronic diseases or cancer is primarily due to the fact that scientists work on isolated molecules cells or topics that are funded and promoted by decision makers in medical cancer establishment Despite existence of over 25 million articles on cancer related topics cancer biology and cure remain mysteries to be solved After a century of cancer research the failure rates of therapies for solid tumors are 90% 5 Current reductionist views on cancer science are irresponsible shut gun approaches and create chaos Outcomes are loss of millions of precious lives and economic drain to society Very little is known about initial events that disturb effective immunity whose function is to monitor and arrest growth of cancerous cells or defend against other external or internal hazardous agents that threaten body s survival The author demonstrates the serious need for systematic understanding of how immune disruptors and aging process would alter effective immunity Outcomes of proposed orderly studies are expected to provide logical foundations for cost effective strategies to promote immunity toward a healthier society The policy makers and medical cancer establishment are urged to return to the common sense that our Forefathers used to serve the public The Lancet ,1908 **Journal of the National Cancer Institute** ,2006 Summaries of papers contained in the journal accompany each issue 19 *Statistical Bulletin* ,1928
