

CHAPTER 1

Computer Analysis of Sequence Data

Hugh G. Griffin and Annette M. Griffin

1. Introduction

DNA sequencing methodology was developed in the late 1970s (1,2) and has become one of the most widely used techniques in molecular biology. The amount of DNA sequencing performed worldwide has increased exponentially each year and this trend will almost certainly continue for the next few years at least. The importance of this technique is underlined by the volume of research funds now being channelled into genome sequencing projects, and by the large sums of money being invested in the development of automated sequencers and sequence analysis systems.

Computers have always been an integral part of DNA sequence analysis. Many large sequencing projects would be virtually impossible without the aid of computers, and the international computer databanks are an essential facility for the storage and retrieval of sequence data. During the 1980s, while the original methods of sequencing were being refined and improved, fast and powerful computer programs were being developed to analyze the copious amounts of data being generated. Indeed, many sequencing projects, such as those utilizing the shotgun approach (3-6) depended on a computer for the assembly of the DNA sequence of random fragments. The development of automated sequencers also depended on the improved quality of computer hardware and software that were necessary for the interpretation of data produced by these instruments.
