ABSTRACT

The present State of the Art report aims at defining and reviewing the current state of the ship design process in the frame of a holistic approach, accounting for various objectives and constraints. The report addresses mainly the design of transportation carriers, though some covered aspects are also relevant to other ship types and floating devices. Design for X is herein defined as the optimization of a ship with respect to specific important performance indicators and properties, like design for safety, design for efficiency, design for arctic operations and design for production. The concept of Design for Safety was introduced and briefly demonstrated on the basis of the design of the largest cruise vessel ever built. The Design for Efficiency of Performance was reviewed with particular emphasis on recent discussions about fuel savings and the reduction of air emissions in maritime transport. Developments in the Design of ships for Arctic Operations were presented, responding to recent increased maritime transport needs in arctic areas. Finally, recent developments in the Design for Production were presented, which is critical to achieving globally competitive shipbuilding businesses.

KEY WORDS

Holistic Ship Design; Design for Safety; Design for Efficiency of Performance; Design for Arctic Operations; Design for Production

INTRODUCTION

Apostolos Papanikolaou

Ship design was in the past more art than science, highly dependent on experienced naval architects, with good background in various fundamental and specialized scientific and engineering subjects, next to practical experience. The design space (multitude of solutions to the design problem) was practically explored using heuristic methods, namely methods deriving from a process of trial and error often over the course of decades. Gradually, trial and error methods were more and more replaced by gained knowledge, which eventually formed a knowledge base, namely statistical data of existing, successful designs.

A systems-based approach to ship design may consider the ship as a complex system integrating a variety of subsystems and their components, e.g. subsystems for cargo storage and handling, energy/power generation and ship propulsion, accommodation of crew/passengers, ship navigation etc. They serve well defined ship functions. Ship functions may be divided into two main categories, namely payload functions and inherent ship functions (Figure 1.1). For cargo ships, the payload functions are related to the provision of cargo spaces, cargo handling and cargo treatment equipment. Inherent ship functions are those related to the carriage of payload, at certain speed, safely from port to port.
