Traffic Control and Transport Planning: Dusan Teodorovic, Katarina Vukadinovic, 2012-12-06 When solving real life engineering problems linguistic information is often encountered that is frequently hard to quantify using classical mathematical techniques This linguistic information represents subjective knowledge Through the assumptions made by the analyst when forming the mathematical model the linguistic information is often ignored On the other hand a wide range of traffic and transportation engineering parameters are characterized by uncertainty subjectivity imprecision and ambiguity Human operators dispatchers drivers and passengers use this subjective knowledge or linguistic information on a daily basis when making decisions Decisions about route choice mode of transportation most suitable departure time or dispatching trucks are made by drivers passengers or dispatchers In each case the decision maker is a human The environment in which a human expert human controller makes decisions is most often complex making it difficult to formulate a suitable mathematical model Thus the development of fuzzy logic systems seems justified in such situations In certain situations we accept linguistic information much more easily than numerical information In the same vein we are perfectly capable of accepting approximate numerical values and making decisions based on them In a great number of cases we use approximate numerical values exclusively It should be emphasized that the subjective estimates of different traffic parameters differs from dispatcher to dispatcher driver to driver and passenger to passenger
