Computed Tomography In Head Injuries:

Computed Tomography in Head Injuries W. Lanksch, T. Grumme, E. Kazner, 2012-12-06 The introduction of computed tomography in the diagnosis of pathological intracranial conditions has had considerable significance in cases of cranio cerebral injury The decisive diagnostic advantage lies in the possibility of demonstrating both gross pathological change directly as well as secondary changes in normal brain structures Computed tomography has proved its considerable worth especially in evaluation of patients with craniocerebral injury and its sequelae The capabilities of CT were quickly recognized and use of the technique spread rapidly It is likely that CT will be available within a few years in all hospitals and clinics treating patients with craniocerebral injury We believe it appropriate to present a detailed report on our experience with CT in 1800 cases of craniocerebral injury treated in the neurosurgical departments in München Großhadern and Berlin Charlottenburg over a period of five years Both acute posttraumatic complications and late sequelae are discussed extensively A large number of illustrations is provided in order to facilitate the reader's introduction to CT diagnosis The great interest in our conjoint study originally published in the German language induced us to translate this book and to update the clinical material We wish to thank the Stiftung Volkswagenwerk the Senat of Berlin the Ludwig Maximilians Universität in Munich and the Freie Universität of Berlin for the generous financial support which made this study possible

Computerized Tomography Brain Metabolism Spinal Injuries W. Driesen, Mario Brock, M. Klinger, 2012-12-06 W DRIESEN This volume contains the original text of 60 papers delivered at the 32nd Annual Meeting of the German Society for Neurosurgery held in Tübingen 22nd to 25th April 1981 They represent a selection from 91 papers submitted a third of which had to be excluded on critical analysis This was deemed necessary on account of costs and in order to keep the volume of a size and standard usually achieved within the last few years Three main subjects were considered 1 changes in methods of investigation and treatment of neurosurgical conditions brought about by the use of computerised axial tomography C A T scanning 2 papers dealing with fundamental research concerned with normal and abnormal cerebral metabolism 3 trauma to the vertebral column and spinal cord and its sequelae and 4 free communications The organisers of this meeting tried in contradistinction to previous custom to shift the emphasis away from highlighting major communications and so to remain true to their intention to allow experts in their fields to introduce their subjects and pin point problems to which subsequent speakers could then address them selves in detail in their own papers In my view this did occur in a meaningful way although not to perfection a goal always difficult to attain
