Computer Communications R. COLE, 2013-12-19 The subject of computer communications is changing very rapidly Improvements in terminal access aligned with the development of timesharing has brought hands on experience to a large number of non specialist users Computer networks have made available vast computing resources and data banks to these users This book is for anyone familiar with using computers who wishes to understand the techniques used in computer communications It is also an introduction to the architecture of present day computer communication systems I would like to thank Roland Ibbett Steve Treadwell Peter Kirstein and Del Thomas for their invaluable advice and encouragement My thanks also to Malcolm Stewart and the staff at Macmillan The late Gareth Pugh encouraged my interest in computer communications and provided the opportunity to develop the material for this book The text was formatted on a UNIX computer system I am grateful to Professor Kirstein for permission to use this system I am indebted to NEC Telecommunications Europe for the use of a spinwriter printer on which the master copy was produced Finally no amount of words can express my debt to Jo this project and Rosemary for patiently bearing with over the last three years *Computer Communication Networks* R.L. Grimsdale, F.F. Kuo, 1975-02-28 In 1968 the Advanced Research Projects Agency ARPA of the U S Department of Defense began implementation of a computer communication network which permits the interconnection of heterogeneous computers at geographically distributed centres throughout the United States This network has come to be known as the ARPANET and has grown from the initial four node configuration in 1969 to almost forty nodes including satellite nodes in Hawaii Norway and London in late 1973 The major goal of ARPANET is to achieve resource sharing among the network users The resources to be shared include not only programs but also unique facilities such as the powerful ILLIAC IV computer and large global weather data bases that are economically feasible when widely shared The ARPANET employs a distributed store and forward packet switching approach that is much better suited for computer communications networks than the more conventional circuit switching approach Reasons favouring packet switching include lower cost higher capacity greater reliability and minimal delay All of these factors are discussed in these Proceedings **Computer Communications: Systems and applications** Wushow Chou, 1985-01-01 Computer Networking and Communication Systems Connor Butler, 2020-09-08 A computer network is defined as a digital telecommunications network in which computing devices share resources using data links between nodes Data links can be established over cable media or wireless media Computer networks support a number of services and applications such as digital audio digital video and access to the World Wide Web In a computer network data is transmitted or received in the form of packets between nodes Local Area Network Wide Area Network and Metropolitan Area Network are the three main types of networks The chief components of computer networks are servers transmission media clients network interface card network operating system etc A communication system is a collection of communication networks relay stations transmission systems tributary stations

and data terminal equipment that are able to interoperate and interconnect Communication systems can be of different types depending on the type of media and technology used and application area such as optical communication system radio communication system tactical communications system etc This book discusses the fundamentals as well as modern approaches of computer networking Also included in it is a detailed explanation of the various concepts and applications of communication systems This book on computer networking and communication systems is a collective contribution of a renowned group of international experts

**Performance of Computer Communication Systems** Boudewijn R. Haverkort,1998-12-04 Computer communication systems or distributed systems are now able to perform an increasingly diverse range of functions This text aims to provide the techniques and methods to evaluate communication systems and ensure their functionality and the quality of their design It takes a non mathematical problem solving approach and includes assessment techniques for single server queues networks of queues and stochastic petri nets

Computer communications is one of the most rapidly developing technologies and it is a subject with which everyone in the computer systems profession should be familiar Computer communications and networks is an introduction to communications technology and system design for practising and aspiring computer professionals The subject is described from the computer system designer s point of view rather than from the communications engineer s viewpoint The presentation is suitable for introductory reading as well as for reference The emphasis is on practical rather than theoretical aspects and on technology which will become more important in the future The majority of the subject matter applies to civil and military communications but some aspects which are unique to military applications have been included where considered significant Computer communications is a rapidly changing and highly complex subject Sufficient practical knowledge of the subject is not usually gained at university or college but is generally developed over a period of several years by trial and error attending courses reading reference books and journals this book attempts to simplify and speed up the process by bringing together a body of information which is otherwise distributed throughout many books and journals The information is presented in a framework which makes a wider understanding of the subject possible Basic knowledge of communications is assumed a general familiarity with computer systems is anticipated in later chapters and where relevant theory is explained

**Computer-Mediated Communication Systems** Elaine B. Kerr,Starr Roxanne Hiltz,2013-09-03 Computer Mediated Communication Systems Status and Evaluation synthesizes current knowledge about computerized conferencing systems electronic mail and office information communication systems It should be of interest both to students and researchers studying this new form of electronic communication and to organizations that are planning the installation of electronic mail

or other computer mediated communication systems and that need to be aware of the information gleaned from the studies presented here The book is organized into four main sections focusing on the following issues 1 What are the important considerations in designing software or choosing a system from the many available options and capabilities 2 What factors determine whether such systems are likely to be accepted or rejected 3 What are the likely impacts of such systems upon the individuals groups and organizations which use them It is not the economic costs and benefits but the social problems and payoffs in the form of enhanced performance and organizational efficiency that should be the main considerations in deciding whether or not to use a computer mediated communication system 4 Given the conditional nature of many of the possible impacts no system should be implemented without formal evaluation and feedback from users to guide the implementation The major kinds of evaluational strategies that have been successfully employed are described in this book
