Computing Meaning Harry Bunt, Reinhard Muskens, 2008-07-03 This book provides an in depth view of the current issues problems and approaches in the computation of meaning as expressed in language Aimed at linguists computer scientists and logicians with an interest in the computation of meaning this book focuses on two main topics in recent research in computational semantics The first topic is the definition and use of underspecified semantic representations i e formal structures that represent part of the meaning of a linguistic object while leaving other parts unspecified The second topic discussed is semantic annotation Annotated corpora have become an indispensable resource both for linguists and for developers of language and speech technology especially when used in combination with machine learning methods The annotation in corpora has only marginally addressed semantic information however since semantic annotation methodologies are still in their infancy This book discusses the development and application of such methodologies

Computing Meaning H. Bunt, Reinhard Muskens, E. Thijsse, 2012-12-06 This book is a collection of papers written by outstanding researchers in the newly emerging field of computational semantics Computational semantics is concerned with the computation of the meanings of linguistic objects such as text fragments spoken dialogue utterances and e mail messages The meaning of such an object is determined partly by linguistic information and partly by information from the context in which the object occurs The information from these sources is combined by processes that infer which interpretation of the object applies in the given context This applies not only to notoriously difficult aspects of interpreting linguistic objects such as indexicals anaphora and metonymy but also to establishing the precise reference of common nouns and the scopes of noun phrases The central issue in computational semantics is how processes of finding and combining the relevant linguistic and contextual information into contextually appropriate meanings can be organised Traditional approaches of applying context information to disambiguated natural language expressions do not work well due to the massive ambiguity in natural language Recent work in computational semantics suggests alternatively to represent linguistic semantic information in formal structures with underspecification and to apply context information in inference processes that result in further specification of these representations Underspecified representation and inference are therefore the key topics in this book The book is aimed at those linguists computer scientists and logicians who take an interest in the computation of meaning and who want to know what is happening in this exciting field of research
