**Imaging Techniques of the CNS of the Neonates** Joseph Haddad,Dominique Christmann,Jean Messer,2012-12-06 There has been increasing interest in neonatal neurology especially since imaging techniques were introduced in the neonatal ward Looking at the natural history of imaging techniques we can identify three main axes of its development Logically it was first essential to image the brain morphologically For this purpose computed tomography was initially used followed by ultra sound However to improve the quality of the images magnetic resonance imaging was introduced Major features of ultrasound and magnetic resonance imaging are their safety and lack of ionization Morphological imaging techniques have proved to be insufficient to explain the mechanisms underlying CNS injuries Thus it was essential to develop functional techniques to assess cerebral hemodynamics and oxygenation The use of Doppler ultrasound PET scanning SPECT scanning and more recently NIRS have widened our knowledge of general neurological problems Finally to achieve our goal of attaining a better understanding of CNS injuries it is important to assess cerebral cellular metabolism

Magnetic resonance spectroscopy was introduced to achieve this goal We hope that this book links these different techniques in order to widen our horizon The future is promising and bound to provide further develop ments which however can only be understood if we grasp the present level of development *Magnetic Resonance Imaging of CNS Disease* Douglas H.
