Coal Primer:

The Coal Primer William P. Rogers,1978 U.S. Coal Marc Humphries,2004 The US coal industry has gone through a number of gradual shifts in recent decades The industry has become more concentrated and mine productivity has improved More low sulphur coal and less high sulphur coal is today being produced Less coal is exported in part because of a strong US dollar Improved production methods such as greater utilisation of and improvements in longwall mining technology have lowered the cost of underground mining although surface mining continues to hold a substantial cost advantage The United States is well endowed with coal The total demonstrated resource base is estimated by the Energy Information Administration EIA at 508 billion short tons of which about 274 billion short tons are classified as recoverable reserves US recoverable reserves are estimated at 25% of total world reserves Production of US coal reached an all time high in 2001 at 1 121 million short tons Coal supplies 22% of the nation s energy demand but 52% of its electricity needs EIA forecasts coal to fall to 47% of the US electricity market by 2025 because of increased competition from natural gas About 1 063 million short tons of coal were consumed in the United States in 2001 90% of which was used in the electric power sector Currently railroads move about 65% of all coal barges transport about 15% and trucks about 11% The outlook for US coal is mixed While forecasts predict steady growth in coal supply and demand the increased production is expected to come from fewer larger mines and fewer producers Continued competition from natural gas is likely to put pressure on coal prices for the foreseeable future
