Improvement of Buildings' Structural Quality by New Technologies Christian Schauer, ENG. Federico Mazzolani, Gerald Huber, Gianfranco de Matteis, Heiko Trumpf, Heli Koukkari, Jean-Pierre Jaspert, Luis Bragança, 2005-01-20 Launched in May 2000 the aims of the COST C12 cooperative action were to develop combine and disseminate new technical engineering technologies to improve the quality of urban buildings to propose new technical solutions to architects and planners to reduce the disturbance caused by construction in urban areas and improve urban quality of life This

Guidelines for Evaluating Process Plant Buildings for External Explosions and Fires CCPS (Center for Chemical Process Safety), 2010-09-09 Dedicated to the Memory and Spirit of Donald F Othmer Though there are many industry practices for building design and siting they do not always apply to all sectors of the industry or ensure consistent levels of safety This practical book written by the same author as API Recommended Practice 752 provides the details to implement the recommended practice Management of Hazards Associated with Location of Process Plant Buildings Its contents include safety guidelines on fire and explosion risks to process plant buildings as a result of events external to the building which can apply across the spectrum of industries and to conditions at any site The book also offers guidance on assessing screening and managing risks associated with building design and siting Two appendices give extensive coverage of explosion and fire phenomena and effects and principles of blast resistant design *Seismic Resistant Steel Structures* Victor Gioncu, Federico

M. Mazzolani, 2000-11-10 The catastrophic earthquakes of the last decades Mexico City 1985 Loma Prieta 1989 Northridge 1994 Kobe 1995 have seriously undermined their reputation of steel structures which in the past represented the most suitable solution for seismic resistant structures. Even in very few cases the performance of steel joints and members was unexpectedly bad showing that it was due to some lacks in the current design concept. As a consequence of the lessons learned from the above dramatic events many progress has been recently achieved in the conception design and construction by introducing the new deals of the performance based design including the differentiation of earthquake types and considering all factors influencing the steel structure behaviour under strong ground motions. In this scenario the aim of the book is to transfer the most recent achievements into practical rules for a safe design of seismic resistant steel structures. The seven Chapters cover the basic principles and design criteria for seismic resistant steel structures which are applied to the main structural typologies like moment resistant frames braced frames and composite structures with particular reference to connections and details.

Displacement-based Seismic Design of Structures M. J. N. Priestley, Gian Michele Calvi, Mervyn J. Kowalsky, 2007 Displacement Based Seismic Design of Structures is a book primarily directed towards practicing structural designers who are interested in applying performance based concepts to seismic design. Since much of the material presented in the book has not been published elsewhere it will also be of considerable interest to researchers and to graduate and upper level undergraduate students of earthquake engineering who wish to develop a deeper understanding of how design can be used to control seismic response. The design philosophy is based on determination of the optimum structural strength to achieve a given performance limit state related to a defined level of damage under a specified level of seismic intensity. Emphasis is also placed on how this strength is distributed through the structure. This takes two forms methods of structural analysis and capacity design. It is shown that equilibrium considerations frequently lead to a more advantageous distribution of strength than that resulting from stiffness considerations. Capacity design considerations have been re-examined and new and more realistic design approaches are presented to insure against undesirable modes of inelastic deformation. The book considers a wide range of structural types including separate chapters on frame buildings wall buildings dual wall frame buildings masonry buildings timber structures bridges structures with isolation or added damping devices and wharves. These are preceded by introductory chapters discussing conceptual problems with current force based design seismic input for displacement based

design fundamentals of direct displacement based design and analytical tools appropriate for displacement based design The final two chapters adapt the principles of displacement based seismic design to assessment of existing structures and present the previously developed design information in the form of a draft building code The text is illustrated by copious worked design examples 39 in all and analysis aids are provided in the form of a CD containing three computer programs covering moment curvature analysis Cumbia linear element based inelastic time history analysis Ruaumoko and a general fibre element dynamic analysis program SeismoStruct The design procedure developed in this book is based on a secant stiffness rather than initial stiffness representation of structural response using a level of damping equivalent to the combined effects of elastic and hysteretic damping The approach has been fully verified by extensive inelastic time history analyses which are extensively reported in the text The design method is extremely simple to apply and very successful in providing dependable and predictable seismic response Authors Bios M J N Priestley Nigel Priestley is Professor Emeritus of the University of California San Diego and co Director of the Centre of Research and Graduate Studies in Earthquake Engineering and Engineering Seismology ROSE School Istituto Universitario di Studi Superiori IUSS Pavia Italy He has published more than 450 papers mainly on earthquake engineering and received numerous awards for his research He holds honorary doctorates from ETH Zurich and Cujo Argentina He is co author of two previous seismic design books *Seismic Design of Concrete and Masonry Buildings* and *Seismic Design and Retrofit of Bridges* that are considered standard texts on the subjects G M Calvi Michele Calvi is Professor of the University of Pavia and Director of the Centre of Research and Graduate Studies in Earthquake Engineering and Engineering Seismology ROSE School Istituto Universitario di Studi Superiori IUSS of Pavia He has published more than 200 papers and is co author of the book *Seismic Design and Retrofit of Bridges* that is considered a standard text on the subject has been involved in important construction projects worldwide such as the Rion Bridge in Greece and the upgrading of the Bolu Viaduct in Turkey and is coordinating several international research projects M J Kowalsky Mervyn Kowalsky is Associate Professor of Structural Engineering in the Department of Civil Construction and Environmental Engineering at North Carolina State University and a member of the faculty of the ROSE School His research which has largely focused on the seismic behaviour of structures has been supported by the National Science Foundation the North Carolina and Alaska Departments of Transportation and several industrial organizations He is a registered Professional Engineer in North Carolina and an active member of several national and international committees on Performance Based Seismic Design *2000 IBC Structural/seismic Design Manual* ,2001 **Further Development of Tubular Eccentrically Braced Frame Links for the Seismic Retrofit of Braced Steel Truss Bridge Piers** Jeffrey W.
