*Dynamics in Action* Alicia Juarrero,2002-01-25 What is the difference between a wink and a blink The answer is important not only to philosophers of mind for significant moral and legal consequences rest on the distinction between voluntary and involuntary behavior However action theory the branch of philosophy that has traditionally articulated the boundaries between action and non action and between voluntary and involuntary behavior has been unable to account for the difference Alicia Juarrero argues that a mistaken 350 year old model of cause and explanation one that takes all causes to be of the push pull efficient cause sort and all explanation to be prooflike underlies contemporary theories of action Juarrero then proposes a new framework for conceptualizing causes based on complex adaptive systems Thinking of causes as dynamical constraints makes bottom up and top down causal relations including those involving intentional causes suddenly tractable A different logic for explaining actions as historical narrative not inference follows if one adopts this novel approach to long standing questions of action and responsibility      **Dynamic Behavior of Materials, Volume 1** Vijay

Gibbs, 1902      **The Psychoanalytic Review**, 1929      Dynamic Patterns J. A. Scott Kelso, 1995 foreword by Hermann Haken

For the past twenty years Scott Kelso's research has focused on extending the physical concepts of self-organization and the mathematical tools of nonlinear dynamics to understand how human beings and human brains perceive, intend, learn, control, and coordinate complex behaviors. In this book Kelso proposes a new general framework within which to connect brain, mind, and behavior. Kelso's prescription for mental life breaks dramatically with the classical computational approach that is still the operative framework for many newer psychological and neurophysiological studies. His core thesis is that the creation and evolution of patterned behavior at all levels from neurons to mind is governed by the generic processes of self-organization. Both human brain and behavior are shown to exhibit features of pattern-forming dynamical systems including multistability, abrupt phase transitions, crises, and intermittency. *Dynamic Patterns* brings together different aspects of this approach to the study of human behavior using simple experimental examples and illustrations to convey essential concepts, strategies, and methods with a minimum of mathematics. Kelso begins with a general account of dynamic pattern formation. He then takes up behavior, focusing initially on identifying pattern-forming instabilities in human sensorimotor coordination. Moving back and forth between theory and experiment, he establishes the notion that the same pattern-forming mechanisms apply regardless of the component parts involved: parts of the body, parts of the nervous system, parts of society, and the medium through which the parts are coupled. Finally, employing the latest techniques to observe spatiotemporal patterns of brain activity, Kelso shows that the human brain is fundamentally a pattern-forming dynamical system poised on the brink of instability. Self-organization thus underlies the cooperative action of neurons that produces human behavior in all its forms.
