# Dynamic reconfiguration of distribution network considering the uncertainty of distributed generation and loads

Qi Liu, Lihong Zhang, Xingquan Ji\* and Huizhe Shi

College of Electrical Engineering and Automation, Shandong University of Science and Technology, Qingdao, China

This study presents a new methodology to perform the distribution network dynamic reconfiguration (DNDR), taking into consideration the stochastic variations of loads and distributed generation (DG) of power. To solve the heavy computational burden that exists in traditional algorithms of the DNDR, this study first establishes the nodal sensitivity models to calculate the nodal variations caused by nodal power variations. Then, the DNDR is executed utilizing a co-evolutionary algorithm with the goal of loss minimization. The stochastic power flow calculations (PFCs) based on the nodal sensitivity are performed in the DNDR to handle the power fluctuations of the DGs and loads. Finally, the modified IEEE 33-bus test system and a practical distribution system are used for simulations. The simulation results validate the quickness and effectiveness of the proposed DNDR method.

## 1 Introduction

### 1.1 Literature review

The distribution network reconfiguration (DNR) can adjust the network topology and improve the performance of distribution networks by combining the open/closed states of line switches. The goals of the DNR include reducing the power losses (Lothi et al., 2020), improving system reliability (Kiammehr et al., 2019), enhancing system resilience (Sun et al., 2022), reducing voltage drops (Song et al., 2020), and managing energy (Gao et al., 2022a). The DNR plays an important role in the distribution automation of the system.

It is usually formulated as a complex non-linear optimization problem. The solution algorithms for the DNR include intelligent optimization algorithms, heuristic algorithms, and mathematical programming algorithms. Intelligent optimization algorithms, such as the genetic algorithm, honeybee mating optimization algorithm, particle swarm optimization algorithm, and harmony search algorithm, have been successfully applied in DNR (Ravosta et al., 2019; Jafari et al., 2020; Lotfi and Ghani, 2021; Hinczi et al., 2022). However, the tremendous amount of computation of intelligent optimization algorithms greatly limits their engineering applications. The heuristic algorithms can solve the DNR problem with high speed. In the study by Haridi and Das (2023), a two-stage heuristic algorithm based on the power flow analysis is used for DNR. Zhao et al. (2020) proposed the switch opening and exchange method for DNR. Recently, efficient mathematical programming algorithms, such as convex programming, have been

## **Dynamic Reconfiguration:**

*Dynamic Reconfiguration* Ramachandran Vaidyanathan, Jerry Trahan, 2004-01-31 *Dynamic Reconfiguration Architectures and Algorithms* offers a comprehensive treatment of dynamically reconfigurable computer architectures and algorithms for them. The coverage is broad starting from fundamental algorithmic techniques ranging across algorithms for a wide array of problems and applications to simulations between models. The presentation employs a single reconfigurable model, the reconfigurable mesh, for most algorithms to enable the reader to distill key ideas without the cumbersome details of a myriad of models. In addition to algorithms, the book discusses topics that provide a better understanding of dynamic reconfiguration, such as scalability and computational power, and more recent advances such as optical models, run-time reconfiguration on FPGA and related platforms, and implementing dynamic reconfiguration. The book, featuring many examples and a large set of exercises, is an excellent textbook or reference for a graduate course. It is also a useful reference to researchers and system developers in the area.

**Component Deployment** Judith Bishop, 2002-06-14

Deployment is the act of taking components and readying them for productive use. There may be steps following deployment, such as installation or management-related functions, but all decisions about how to configure and compose, assemble a component are made at the deployment stage. This is therefore the one opportunity in the software lifecycle to bridge the gap between what the component developer couldn't know about the deployment environment and what the environment's developer couldn't know about the open set of deployable components. It is not surprising that deployment as a dedicated step gains importance when addressing issues of system-wide qualities such as coping with constrained resources or preparing for component adaptation and system evolution. Yet component deployment is still a discipline in its infancy; it became mainstream practice only in the mid-1990s. Much of the best practice impulse originated in products like Microsoft's Transaction Server and its approach to attribute-based programming, and later products like Enterprise JavaBeans and now the Corba Component Model. All these address the specific needs of enterprise application servers. However, the potential of the deployment concept goes far beyond this. Deployment can and should touch effectively all truly component-based solutions. The proceedings of *Component Deployment 2002* represent a good cross-section of the gamut of deployment issues. From customization to address source constraints to reconfiguration of deployed systems and from architecture to design to languages, the avid reader will find some contribution.
