

Basic difference between static and dynamic loading

Resistance due to internal elastic forces of structure

In static problem: Response due to static loading is displacement only.

Static

Accelerations producing inertia forces (inertia forces form a significant portion of load equilibrated by the internal elastic forces of the structure)

In dynamic problem: Response due to dynamic loading is displacement, velocity and acceleration.

True,1969 A study was made of pore pressure in sand subjected to a blast overpressure Results indicated that the lower the permeability of the soil and the shorter the duration of the positive phase of load the greater the attenuation of the pore pressure at depth Results also indicated that the attenuation of the pore pressure at depth is not significantly affected by the magnitude of the overpressure The influence of moisture content on attenuation was not consistent in the experiment An attenuation relationship has been developed to represent the experimental results and similar data from other sources Velocity of pore pressure propagation was found to increase with increasing permeability decreasing duration of overpressure and increasing degree of saturation It was not significantly affected by the magnitude of the overpressure Author *Building Technology Publications* ,1983 *Pamphlets on Forestry in Virginia* ,1929 **Introduction to Forensic Science** James T.
