Dynamic Logic Foundations Of Computing:

Dynamic Logic David Harel, Dexter Kozen, Jerzy Tiuryn, 2000-09-29 This book provides the first comprehensive introduction to Dynamic Logic Among the many approaches to formal reasoning about programs Dynamic Logic enjoys the singular advantage of being strongly related to classical logic Its variants constitute natural generalizations and extensions of classical formalisms For example Propositional Dynamic Logic PDL can be described as a blend of three complementary classical ingredients propositional calculus modal logic and the algebra of regular events In First Order Dynamic Logic DL the propositional calculus is replaced by classical first order predicate calculus Dynamic Logic is a system of remarkable unity that is theoretically rich as well as of practical value It can be used for formalizing correctness specifications and proving rigorously that those specifications are met by a particular program Other uses include determining the equivalence of programs comparing the expressive power of various programming constructs and synthesizing programs from specifications This book provides the first comprehensive introduction to Dynamic Logic It is divided into three parts The first part reviews the appropriate fundamental concepts of logic and computability theory and can stand alone as an introduction to these topics The second part discusses PDL and its variants and the third part discusses DL and its variants Examples are provided throughout and exercises and a short historical section are included at the end of each chapter

Logical Foundations of Computer Science S. I. Adinolfi, 1997-05-28 A Sobolev gradient of a real valued functional is a gradient of that functional taken relative to the underlying Sobolev norm This book shows how descent methods using such gradients allow a unified treatment of a wide variety of problems in differential equations Equal emphasis is placed on numerical and theoretical matters Several concrete applications are made to illustrate the method These applications include 1 Ginzburg Landau functionals of superconductivity 2 problems of transonic flow in which type depends locally on nonlinearities and 3 minimal

surface problems Sobolev gradient constructions rely on a study of orthogonal projections onto graphs of closed densely defined linear transformations from one Hilbert space to another These developments use work of Weyl von Neumann and Beurling
