Dynamical Systems And Cosmology:

Dynamical Systems and Cosmology A.A. Coley, 2003-10-31 Dynamical systems theory is especially well suited for determining the possible asymptotic states at both early and late times of cosmological models particularly when the governing equations are a finite system of autonomous ordinary differential equations In this book we discuss cosmological models as dynamical systems with particular emphasis on applications in the early Universe We point out the important role of self similar models We review the asymptotic properties of spatially homogeneous perfect fluid models in general relativity We then discuss results concerning scalar field models with an exponential potential both with and without barotropic matter Finally we discuss the dynamical properties of cosmological models derived from the string effective action This book is a valuable source for all graduate students and professional astronomers who are interested in modern developments in cosmology

Dynamical Systems in Cosmology John Wainwright, George Francis Rayner Ellis, 1997-01 The first book to show how modern dynamical systems theory can help us both in understanding the evolution of cosmological models and in relating them to real cosmological observations

Dynamical Systems in Cosmology N. Chan, 2012 In this PhD thesis the role of dynamical systems in cosmology has been studied Many systems and processes of cosmological interest can be modelled as dynamical systems Motivated by the concept of hypothetical dark energy that is believed to be responsible for the recently discovered accelerated expansion of the universe various dynamical dark energy models coupled to dark matter have been investigated using a dynamical systems approach The models investigated include quintessence three form and phantom fields interacting with dark matter in different forms The properties of these models range from mathematically simple ones to those with better physical motivation and justification It was often encountered that linear stability theory fails to reveal behaviour of the dynamical systems As part of this PhD programme other techniques such as application of the centre manifold theory construction of Lyapunov functions were considered Applications of these so called methods of non linear stability theory were applied to cosmological models Aforementioned techniques are powerful tools that have direct applications not only in applied mathematics theoretical physics and engineering but also in finance economics theoretical immunology neuroscience and many more One of the main aims of this thesis is to bridge the gap between dynamical systems theory an area of applied mathematics and cosmology an exciting area of physics that studies the universe as a whole

Dynamical Systems in Cosmology and Astrophysics Ulf Nilsson, 1998 **Dynamical Systems in Cosmology** Nyein Chan, 2012 *Advances in Computational Methods and Modeling for Science and Engineering* Hari M

consolidates diverse topics serving as a one stop guide for individuals seeking a comprehensive understanding of the subject matter Sections focus on mathematical techniques that provide global solutions for models arising in engineering and scientific research applications by considering their long term benefits The mathematical treatment of these models is very helpful in understanding these models and their real world applications The methods and modeling techniques presented are useful for mathematicians engineers scientists and researchers working on the mathematical treatment of models in a wide range of applications including disciplines such as engineering physics chemistry computer science and applied mathematics Provides comprehensive coverage of computational methods and modeling techniques applicable to science and engineering Emphasizes practical application by providing real world examples Offers practical guidance and step by step examples to help readers overcome challenges related to implementing algorithms interpreting results and effectively applying computational methods in their work

Modern Theoretical and Observational Cosmology Manolis Plionis, Spiros Cotsakis, 2012-12-06 Proceedings of the second Hellenic Cosmology Meeting held in the National Observatory of Athens Penteli 19 20 April 2001

Methods in the Qualitative Theory of Dynamical Systems in Astrophysics and Gas Dynamics O.I. Bogoyavlensky, 1985-08 Homogeneous cosmological models self similar motion of self gravitating gas and motion of gas with homogeneous deformation have important applications in the theory of evolution of the universe In particular they can be applied to the theory of explosions of stars formation of galaxies pulsation of alternating stars etc The equations of general relativity and Newtonian gas dynamics in the cases mentioned above are reduced to systems of a finite but quite large number of ordinary differential equations In the last two decades these multi dimensional dynamical systems were and still are being analyzed by means of traditional analytic and numerical methods Important dynamical modes of some solutions were thus established These include oscillatory modes of the space time metric near a cosmological singularity self similar motion of self gravitating gas with a shock wave and an expanding cavity inside as in an explosion of a star collapse of an ellipsoid of self gravitating dust into a disc and others However the multi dimensional dynamical systems in question are so complex that a complete analysis of all dynamical modes of the solutions by means of well known traditional analytic methods does not seem feasible Therefore the development of effective methods of qualitative analysis of multi dimensional dynamical systems and their application to the problems of astrophysics and gas dynamics previously unsolved by traditional methods becomes especially urgent

Order and Chaos in Dynamical Astronomy George Contopoulos, 2013-03-14 There have been many books on Dynamical Astronomy up to now Many are devoted to Celestial Mechanics but there are also several books on Stellar and Galactic Dynamics The first books on stellar dynamics dealt mainly with the statistics of stellar motions e g Smart s Stellar Dynamics 1938 or Trumpler and Weaver s Statistical Astronomy 1953 A classical book in this field is Chandrasekhar s Principles of Stellar Dynamics 1942 that dealt mainly with the time of relaxation the solutions of Liouville s equation and the dynamics of clusters In the Dover edition of this book 1960 an extended Appendix was added containing the statistical mechanics of stellar systems a quite modern subject at that time The need for a classroom book was covered for several years by the book of Mihalas and Routly Galactic Astronomy 1969 But the most complete book in this field is Binney and Tremaine s Galactic Dynamics 1987 This book covers well the classical topics of stellar dynamics and many subjects of current interest Another classical book in dynamical astronomy is the extensive 4 Volume treatise of Hagihara Celestial Mechanics 1970 1972 1974 1975 In more recent years much progress has been made on new topics that are of vital interest

for stellar and galactic dynamics The main new topic is Chaos The progress of the theory of chaos has influenced considerably the area of stellar and galactic dynamics The study of order and chaos has provided a new dimension in dynamics
