## **Advanced Gas Turbine Cycles:**

*Advanced Gas Turbine Cycles* J.H. Horlock, 2013-10-22 Primarily this book describes the thermodynamics of gas turbine cycles The search for high gas turbine efficiency has produced many variations on the simple open circuit plant involving the use of heat exchangers reheating and intercooling water and steam injection cogeneration and combined cycle plants These are described fully in the text A review of recent proposals for a number of novel gas turbine cycles is also included In the past few years work has been directed towards developing gas turbines which produce less carbon dioxide or plants from which the CO<sub>2</sub> can be disposed of the implications of a carbon tax on electricity pricing are considered In presenting this wide survey of gas turbine cycles for power generation the author calls on both his academic experience at Cambridge and Liverpool Universities the Gas Turbine Laboratory at MIT and Penn State University and his industrial work primarily with Rolls Royce plc The book will be essential reading for final year and masters students in mechanical engineering and for practising engineers

*Evaluation of Advanced Gas Turbine Cycles* Ashok Rao, Flour Daniel, Inc.\*, Gas Research Institute, 1993

*Ericsson Cycle Gas Turbine Powerplants* W. H. Krase, 1979 A preliminary exploration of a potentially low cost gas turbine thermodynamic cycle that appears capable of unprecedented efficiency The cycle approximates an Ericsson cycle and uses stepwise expansions in turbines with intervening reheat and stepwise compression with intervening intercooling At a peak cycle temperature of 1500 deg F and using five stages of compression and expansion a 50 percent thermal efficiency is attainable with previously demonstrated component performance This performance requires no extremes of pressure or temperature no new materials and no fundamentally new techniques The cycle is not complicated in comparison with advanced gas turbine steam turbine cycles now being considered for high efficiency fossil fuel fired plants In addition the low temperatures required by the Ericsson cycle would eliminate many problems presented by other cycles This analysis indicates that detailed study of fuels and applications design and plant layout costs and fuel processing losses for the Ericsson cycle approximation is warranted
