

Mechanical Devices - parts that move when it is working.

Levers - help provide mechanical advantage.

There are three elements at work: the effort, the load and the position of the fulcrum

First Order Levers (Class 1)

Examples: weighing scales, see saw, scissors, hammer pulling a nail

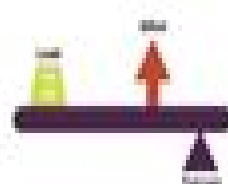

Second Order Levers (Class 2)

Examples: nut cracker, car door, wheel barrow, bottle opener

Third Order Levers (Class 3)

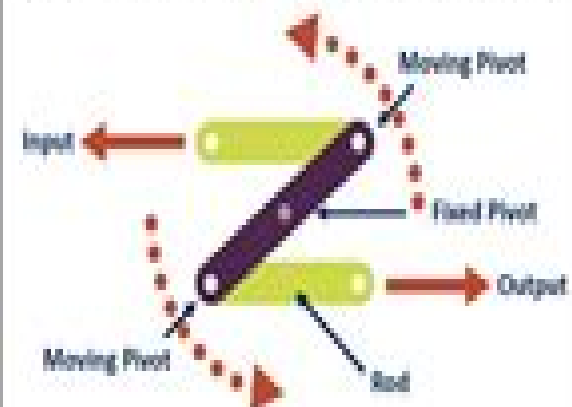

Examples: tongs, tweezers, fishing rod, stapler, sweeping with a broom

Linkages - are mechanisms that use rigid parts to:

- Change the magnitude of a force
- Change the direction of a force
- Transform into a different motion

A linkage is a mechanism made by connecting together levers. Consisting of a system of rods connected by pivots.

Types of Linkages

Bell Crank Linkage

Input direction is converted through 90° horizontal motion to vertical

Product Example: steering on bicycle

Crank and Slider

Converts rotary motion into reciprocating motion and vice versa.

Product Example: Engine pistons

Treadle Linkage

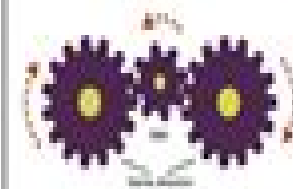

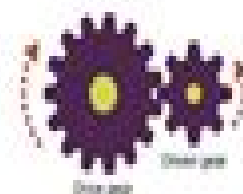

Converts rotary motion into oscillating motion and vice versa.

Product Example: Elliptical trainer

Gears - cog wheels are meshed to create gear trains.

- A single gear train has a drive cog which rotates the 'driven gear'
- Gear ratios can be worked out by comparing the number of teeth

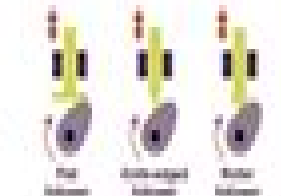

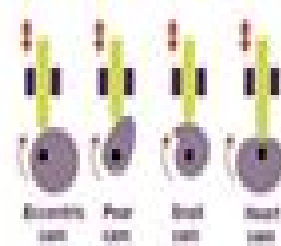

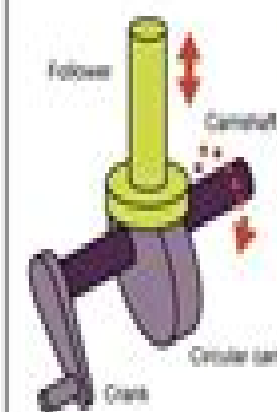

- An idler gear ensures that the direction of the drive gear and the driven gear are the same.
- The idler gear sits between the two gears and transfers the drive

Pulleys and Belts - drive belts are used to transfer drive from one pulley to another.

Pulleys reduce the effort needed to lift.
