

Ecological Methods

Peter Alan Henderson, *Floras Conservation Ltd and The University of Oxford, UK*

Ecological studies involve setting objectives and formulating a sampling programme; sampling in the field and sorting, identifying and measuring the organisms retrieved; and data analysis. The results can be used to derive absolute or relative population measures, construct life tables, probe population dynamics and estimate biodiversity.

Introduction

The study of plant and animal populations has required the development of a large body of methods that use techniques derived from mathematics, physics, chemistry, biochemistry and systematics, combined with the ancient skills of the hunter and fisherman. The particular methods required will be determined by the objectives of the study and these must be clearly defined at the outset. Although it is common to divide the ecological methods used by botanists from those of zoologists, they share many common features and both will be considered here; the techniques used to study sedentary animals such as barnacles will be closer to those of the botanist than of the ornithologist. Studies can be broadly classified as intensive or extensive. Extensive studies are carried out over larger areas than intensive studies and seek to obtain information on the distribution and abundance of species for conservation and management purposes. Intensive studies involve the repeated observation of a population to gain insight into demographic processes.

All ecological studies follow a sequence of steps. First the objectives are defined and a sampling programme is formulated. Second, the field sampling is undertaken, the organisms are sorted and identified, and relevant measurements such as size or age are recorded. Finally, the data is tabulated and analysed, usually using a computer, and the results are reported. Care is required at all stages to ensure that the study is realistic given the manpower and other resources available.

Detailed accounts of the methods available to ecologists are given in Southwood and Henderson (2000) and the numerical methods are described in Krebs (1999) and Legendre and Legendre (1998).

Absolute and Relative Measures of Populations

Absolute estimates express population size in numbers per unit area or volume. Often it is more appropriate to count the number of animals per unit of habitat, e.g. per leaf or

per host. Such measures are termed population intensity and are more meaningful than absolute number when the objective is an assessment of crop or host damage. Relative methods produce some measure of abundance based on the number caught per unit of effort or trapping. Relative methods are frequently used when resources are limited, when it is desired to quickly obtain a general sample of the species present, or when the organism is difficult to sample quantitatively. Given constant sampling efficiency, relative methods can be used to follow population trends or compare abundance between habitats. Both absolute and relative methods will be discussed below.

The Sampling Programme

Without a well-designed sampling programme, an ecological study will likely fail. As it is not usually possible to count all the animals or plants in a population, samples must be taken and the population has to be estimated. The design of this sampling programme is a key ecological skill and will require decisions about the subdivision of the habitat, the size of the sampling unit, the number of samples, the spatial pattern of the samples and the time of sampling. All ecosystems are seasonal and it is important to identify the appropriate time of year when the life stages of interest are present. Knowledge about the pattern of distribution of the population is particularly relevant. While some organisms may be randomly distributed, highly aggregated patterns are far more common and this must be taken into account when deciding how to sample. A preliminary survey may be necessary before the final sampling design is formulated.

Absolute Population Estimates

The number of individuals in a fixed unit of habitat must be counted or the population studied by mark-recapture, removal sampling or distance sampling methods.

Ecological Methods:

Ecological Methods T. R. E. Southwood, Peter A. Henderson, 2009-04-13 This classic text whose First Edition one reviewer referred to as the ecologists bible has been substantially revised and rewritten. Not only have the advances made in the field since the Second Edition been taken into account but the scope has been explicitly extended to all macroscopic animals with particular attention being paid to fish as well as other vertebrates. Ecological Methods provides a unique synthesis of the methods and techniques available for the study of populations and ecosystems. Techniques used to obtain both absolute and relative population estimates are described and approaches to the direct measurement of births, deaths, migration and the construction and interpretation of life tables are reviewed. The text is extensively illustrated, clearly describing a wide range of equipment and methods of analysis. Comprehensive and up to date bibliographies to each chapter fully cover the relevant literature and references are given to available computer programs and internet addresses. The book has an active web site providing additional illustrations, details of equipment and programs and references to work published since the revision was completed. Like the earlier editions, this book will be an indispensable source of reference to researchers and students at all levels in the fields of ecology, entomology and zoology. Completely revised and rewritten edition of a classic. Scope extended to all macroscopic animals, notably fish and other vertebrates. Active web site displaying additional material. References to computer programmes and internet addresses throughout the text. Affordable paperback. [Ecological Methods](#) Peter A. Henderson, T. R. E. [Ecological Methods in Forest Pest Management](#) David Wainhouse, 2005 Throughout the world there is a need to control forest insect pests. This text focuses predominantly on insect pests but many examples relate to fungal pathogens, some of which are vectored by forest insects. It looks at the development of Integrated Pest Management (IPM).

Ecological Methodology Charles J. Krebs, 1999 This coherent text translates the methods of statisticians into ecological English so that students may readily apply these methods to the real world. Ecological Methodology Second Edition provides a balance of material on animal and plant populations. It teaches students of ecology how to design the most efficient tests in order to obtain maximum precision with minimal work. The first part of the text focuses on biological and technical issues in statistical methodology. Students learn about advances that have been made in designing better sampling devices along with the techniques and equipment used for sampling. The second part deals with creating solid statistical design and presents all
