A Synthesis Of Evolutionary Theory:

The Evolutionary Synthesis Ernst Mayr, William B. Provine, 1998 Biology was forged into a single coherent science only within living memory In this volume the thinkers responsible for the modern synthesis of evolutionary biology and genetics come together to analyze that remarkable event In a new Preface Ernst Mayr calls attention to the fact that scientists in different biological disciplines varied considerably in their degree of acceptance of Darwin s theories Mayr shows us that these differences were played out in four separate periods 1859 to 1899 1900 to 1915 1916 to 1936 and 1937 to 1947 He thus enables us to understand fully why the synthesis was necessary and why Darwin s original theory that evolutionary change is due to the combination of variation and selection is as solid at the end of the twentieth century as it was in 1859

Evolutionary Theory: Robert G. B. Reid, 2012-02-17 My favourite literary critique comes from the little girl in James Thurber s *The Darlings at the Top of the Stairs* This book tells me more about penguins than I wanted to know My daughter Clio who learned the alphabet by typing words for the first draft of this book has similar sentiments about the present work and she suggests that my next effort should be quite short maybe four pages However this is an epistemological work in a very general sense It deals not only with the facts of evolutionary biology and its interpretive logic but also considers intellectual progress and prejudice soul searching and gullibility and heuristic induction and wishful thinking which may be more about penguins than students accustomed to cut and dried assertions and teachers who cut and dry might want to know Some of my penguins progenitors of significant epistemological lines have been detailed down to the last feather including a number of birds that by conventional wisdom nobody takes seriously Some are sketches copied from other naturalists others are phantoms that cry out for an incarnation denied by a combination of accident and time constraints Students in my courses in comparative physiology and the history and philosophy of biology have been the main sounding boards for my ideas Richard Ring has always listened with polite interest when I have expatiated **Unifying Biology** Vassiliki Betty Smocovitis, 2020-11-10 *Unifying Biology* offers a historical reconstruction of one of the most important yet elusive episodes in the history of modern science the evolutionary synthesis of the 1930s and 1940s For more than seventy

years after Darwin proposed his theory of evolution it was hotly debated by biological scientists It was not until the 1930s that opposing theories were finally refuted and a unified Darwinian evolutionary theory came to be widely accepted by biologists Using methods gleaned from a variety of disciplines Vassiliki Betty Smocovitis argues that the evolutionary synthesis was part of the larger process of unifying the biological sciences At the same time that scientists were working toward a synthesis between Darwinian selection theory and modern genetics they were according to the author also working together to establish an autonomous community of evolutionists Smocovitis suggests that the drive to unify the sciences of evolution and biology was part of a global philosophical movement toward unifying knowledge In developing her argument she pays close attention to the problems inherent in writing the history of evolutionary science by offering historiographical reflections on the practice of history and the practice of science Drawing from some of the most exciting recent approaches in science studies and cultural studies she argues that science is a culture complete with language rituals texts and practices Unifying Biology offers not only its own new synthesis of the history of modern evolution but also a new way of doing history

A Synthesis of Evolutionary Theory Walter L. Slocum,1962 Herbert H. Ross,... A Synthesis of Evolutionary Theory Herbert Holdsworth Ross,1962 The Modern Synthesis Thomas E. Dickins,2021 This book is about evolutionary theory It deals with aspects of its history to focus upon explanatory structures at work in the various forms of evolutionary theory as such this is also a work of philosophy Its focus lies on recent debates about the Modern Synthesis and what might be lacking in that synthesis These claims have been most clearly made by those calling for an Extended Evolutionary Synthesis The author argues that the difference between these two positions is the consequence of two things First whether evolution is a considered as solely a population level phenomenon or also a theory of form Second the use of information concepts In this book Darwinian evolution is positioned as a general theory of evolution a theory that gave evolution a technical meaning as the statistical outcome of variation competition and inheritance The Modern Synthesis MS within biology has a particular focus a particular architecture to its explanations that renders it a special theory of evolution After providing a history of Darwinian theory and the MS recent claims and exhortations for an Extended Evolutionary Synthesis EES are examined that see the need for the inclusion of non genetic modes of inheritance and also developmental processes Much of this argument is based around claims that the MS adopts a particular view of information that has privileged the gene as an instructional unit in the emergence of form The author analyses the uses of information and claims that neither side of the debate explicitly and formally deals with this concept A more formal view of information is provided which challenges the EES claims about the role of genes in MS explanations of form whilst being consilient with their own interests in developmental biology It is concluded that the MS implicitly assumed this formal view of information whilst using information terms in a colloquial manner In the final chapter the idea that the MS is an informational theory that acts to corral more specific phenomenal accounts is mooted As such the book argues for a constrained pluralism within biology where the MS describes

those constraints Evolution, the Extended Synthesis Massimo Pigliucci, Gerd B. Muller, 2010-03-26 Prominent evolutionary biologists and philosophers of science survey recent work that expands the core theoretical framework underlying the biological sciences In the six decades since the publication of Julian Huxley's *Evolution: The Modern Synthesis* the spectacular empirical advances in the biological sciences have been accompanied by equally significant developments within the core theoretical framework of the discipline As a result evolutionary theory today includes concepts and even entire new fields that were not part of the foundational structure of the Modern Synthesis In this volume sixteen leading evolutionary biologists and philosophers of science survey the conceptual changes that have emerged since Huxley's landmark publication not only in such traditional domains of evolutionary biology as quantitative genetics and paleontology but also in such new fields of research as genomics and EvoDevo Most of the contributors to *Evolution, the Extended Synthesis* accept many of the tenets of the classical framework but want to relax some of its assumptions and introduce significant conceptual augmentations of the basic Modern Synthesis structure just as the architects of the Modern Synthesis themselves expanded and modulated previous versions of Darwinism This continuing revision of a theoretical edifice the foundations of which were laid in the middle of the nineteenth century the reexamination of old ideas proposals of new ones and the synthesis of the most suitable shows us how science works and how scientists have painstakingly built a solid set of explanations for what Darwin called the grandeur of life Contributors John Beatty Werner Callebaut Jeremy Draghi Chrisantha Fernando Sergey Gavrilets John C Gerhart Eva Jablonka David Jablonski Marc W Kirschner Marion J Lamb Alan C Love Gerd B Muller Stuart A Newman John Odling Smee Massimo Pigliucci Michael Purugganan E rs Szathm ry G nter P Wagner David Sloan Wilson Gregory A Wray Challenging the Modern Synthesis Philippe Huneman, Denis M. Walsh, 2017 Since its origin in the early 20th century the Modern Synthesis theory of evolution has grown to become the orthodox view on the process of organic evolution Its central defining feature is the prominence it accords to genes in the explanation of evolutionary dynamics Since the advent of the 21st century however the Modern Synthesis has been subject to repeated and sustained challenges These are largely empirically driven In the last two decades evolutionary biology has witnessed unprecedented growth in the understanding of those processes that underwrite the development of organisms and the inheritance of characters The empirical advances usher in challenges to the conceptual foundations of evolutionary theory The extent to which the new biology challenges the Modern Synthesis has been the subject of lively debate Many current commentators charge that the new biology of the 21st century calls for a revision extension or wholesale rejection of the Modern Synthesis Theory of evolution Defenders of the Modern Synthesis maintain that the theory can accommodate the exciting new advances in biology The original essays collected in this volume survey the various challenges to the Modern Synthesis arising from the new biology of the 21st century The authors are evolutionary biologists philosophers of science and historians of biology from Europe and North America Each of the essays discusses a particular challenge to the Modern

Synthesis treatment of inheritance development or adaptation Taken together the essays cover a spectrum of views from those that contend that the Modern Synthesis can rise to the challenges of the new biology with little or no revision required to those that call for the abandonment of the Modern Synthesis The collection will be of interest to researchers and students in evolutionary biology and the philosophy and history of the biological sciences *Evolutionary Biology: Contemporary and Historical Reflections Upon Core Theory* Thomas E. Dickins, Benjamin J.A. Dickins, 2023-03-08 This book is reflecting upon core theories in evolutionary biology in a historical as well as contemporary context It exposes the main areas of interest for discussion but more importantly draws together hypotheses and future research directions The Modern Synthesis MS sometimes referred to as Standard Evolutionary Theory SET in evolutionary biology has been well documented and discussed but was also critically scrutinized over the last decade Researchers from diverse disciplinary backgrounds have claimed that there is a need for an extension to that theory and have called for an Extended Evolutionary Synthesis EES The book starts with an introductory chapter that summarizes the main points of the EES claim and indicates where those points receive treatment later in the book This introduction to the subjects can either serve as an initiation for readers new to the debate or as a guide for those looking to pursue particular lines of enquiry The following chapters are organized around historical perspectives theoretical and philosophical approaches and the use of specific biological models to inspect core ideas Both empirical and theoretical contributions have been included The majority of chapters are addressing various aspects of the EES position and reflecting upon the MS Some of the chapters take historical perspectives analyzing various details of the MS and EES claims Others offer theoretical and philosophical analyses of the debate or take contemporary findings in biology and discuss those findings and their possible theoretical interpretations All of the chapters draw upon actual biology to make their points This book is written by practicing biologists and behavioral biologists historians and philosophers many of them working in interdisciplinary fields It is a valuable resource for historians and philosophers of biology as well as for biologists Chapters 8 20 22 and 33 are available open access under a Creative Commons Attribution 4.0 International License via link [springer.com](https://www.springer.com) *Evolutionary, Spiritual Conceptions of Life - Sri Aurobindo, Teilhard de Chardin and Ken Wilber in Comparison* Michael Leicht, 2008-08 Essay from the year 2006 in the subject Philosophy Philosophy of the Present The University of Tomorrow Sri Aurobindo Centre for Advanced Research course Advanced Course in Integral Philosophy 34 entries in the bibliography language English abstract Die Frage nach dem Woher und Wohin des Menschen beschäftigt ihn seit Urzeiten Der heute dominierende Ansatz ist derjenige der Evolutionstheorie In der wissenschaftlichen Sicht wird der Evolutionsprozess aber häufig verkürzt als rein materialistisch und nur auf Zufall beruhend dargestellt Eine evolutionäre spirituelle Sicht des Lebens sieht hingegen in der Evolution einen geistigen Prozess am wirken in dem Göttlichen seiner selbst bewusst wird Im folgenden Text werden die drei verschiedenen Positionen von Sri Aurobindo Hindu Teilhard de Chardin Christ und Ken Wilber Buddhist entwickelt und miteinander verglichen Alle drei zeichnen sich durch eine spirituelle Sicht

The Structure of Evolutionary Theory Stephen Jay Gould,2002-03-21 The world's most revered and eloquent interpreter of evolutionary ideas offers here a work of explanatory force unprecedented in our time a landmark publication both for its historical sweep and for its scientific vision With characteristic attention to detail Stephen Jay Gould first describes the content and discusses the history and origins of the three core commitments of classical Darwinism that natural selection works on organisms not genes or species that it is almost exclusively the mechanism of adaptive evolutionary change and that these changes are incremental not drastic Next he examines the three critiques that currently challenge this classic Darwinian edifice that selection operates on multiple levels from the gene to the group that evolution proceeds by a variety of mechanisms not just natural selection and that causes operating at broader scales including catastrophes have figured prominently in the course of evolution Then in a stunning tour de force that will likely stimulate discussion and debate for decades Gould proposes his own system for integrating these classical commitments and contemporary critiques into a new structure of evolutionary thought In 2001 the Library of Congress named Stephen Jay Gould one of America's eighty three Living Legends people who embody the quintessentially American ideal of individual creativity conviction dedication and exuberance Each of these qualities finds full expression in this peerless work the likes of which the scientific world has not seen and may not see again for well over a century

Sociobiology, Sex, and Science Harmon R. Holcomb,1993-01-01 This book examines sociobiology's validity and significance using the sociobiological theory of the evolution of mating and parenting as an example It identifies and discusses the array of factors that determine sociobiology's effort to become a science providing a rare balanced account more critical than that of its advocates and more constructive than that of its critics It sees a role for sociobiology in changing the way we understand the goals of evolutionary biology the proper way to evaluate emerging sciences and the deep structure of scientific theories The book's premise is that evolutionary biology would not be complete if it did not explain evolutionarily significant social facts about nonhumans and humans It proposes that explanations should be evaluated in terms of their basis in underlying theories research programs and conceptual frameworks

this book is to propose a broad outline for the developmental component that is widely acknowledged to be missing from the modern synthesis of evolutionary theory **Unfinished Synthesis** Niles Eldredge, 1985-11-21 This study provides a stimulating critique of contemporary evolutionary thought analyzing the Modern Synthesis first developed by Theodosius Dobzhansky Ernst Mayr and George Gaylord Simpson The author argues that although only genes and organisms are taken as historic individuals in conventional theory species higher taxa and ecological entities such as populations and communities should also be construed as individuals an approach that yields the ecological and genealogical hierarchies that interact to produce evolution This clearly stated controversial work will provoke much debate among evolutionary biologists systematists paleontologists and ecologists as well as a wide range of educated lay readers
