Chaos In Brain Function Springer Series In Brain Dynamics:

Chaos in Brain Function Erol Başar, 1990-04-27 The analysis of deterministic chaos is currently an active field in many branches of research. Mathematically, all nonlinear dynamical systems with more than two degrees of freedom can generate chaos, becoming unpredictable over a longer time scale. The brain is a nonlinear system par excellence. Accordingly, the concepts of chaotic dynamics have found in the last five years an important application in research on compound electrical activity of the brain. The present volume seeks to cover most of the relevant studies in the newly emerging field of chaotic attractors in the brain. This volume is essentially a selection and reorganization of contributions from the first two volumes in the Springer Series in Brain Dynamics, which were based on conferences held in 1985 and 1987 in Berlin. It also includes a survey of progress in the recording of evoked oscillations of the brain, both at the cellular and EEG levels, and an agenda for research on chaotic dynamics. Although the first publications pointing out evidence of chaotic behavior of the EEG did not appear until the beginning of 1985, the presence of the pioneering scientists in this field gave the participants at the first conference volume a strong impulse toward this field. For me, as conference organizer, having been for a long time active in nonlinear EEG research, the integration of this topic was self-evident. However, the enthusiasm of the conference participants was greater than expected.

Chaos in Brain Function Erol Başar, 1990 *Current Catalog* National Library of Medicine (U.S.), 1991. First multi-year cumulation covers six years 1965-70. **National Library of Medicine Current Catalog** National Library of Medicine (U.S.), 1991. **Information-based methods for neuroimaging: analyzing structure, function and dynamics** Jesus M. Cortés, Daniele Marinazzo, Miguel Angel Muñoz, 2015-05-07. The aim of this Research Topic is to discuss the state of the art on the use of information-based methods in the analysis of neuroimaging data. Information-based methods, typically built as extensions of the Shannon Entropy, are at the basis of model-free approaches which, being based on probability distributions rather than on specific expectations, can account for all possible nonlinearities present in the data in a model-independent fashion. Mutual Information-like methods can also be applied on interacting dynamical variables described by time series, thus addressing the uncertainty reduction or information in one variable by conditioning on another set of variables. In the last years, different information-based methods have been shown to be flexible and powerful tools to analyze neuroimaging data with a wide range of different methodologies, including formulations based on bivariate vs. multivariate representations, frequency vs. time domains, etc. Apart from methodological issues, the information bit as a common unit represents a convenient way to open the road for comparison and integration between different measurements of neuroimaging data in three complementary contexts: Structural Connectivity, Dynamical Functional, and Effective Connectivity and Modelling of brain activity. Applications are ubiquitous, starting from resting state in healthy subjects to modulations of consciousness and other aspects of pathophysiology. Mutual Information-based methods have provided new insights about common principles in brain organization, showing the existence of an active default network when the brain is

at rest It is not clear however how this default network is generated the different modules are intra interacting or disappearing in the presence of stimulation Some of these open questions at the functional level might find their mechanisms on their structural correlates A key question is the link between structure and function and the use of structural priors for the understanding of the functional connectivity measures As effective connectivity is concerned recently a common framework has been proposed for Transfer Entropy and Granger Causality a well established methodology originally based on autoregressive models This framework can open the way to new theories and applications This Research Topic brings together contributions from researchers from different backgrounds which are either developing new approaches or applying existing methodologies to new data and we hope it will set the basis for discussing the development and validation of new Information based methodologies for the understanding of brain structure function and dynamics
