**Combining Advanced Formal Hardware Verification Techniques** Erik Henry Reeber, 2007 This dissertation combines formal verification techniques in an attempt to reduce the human effort required to verify large systems formally One method to reduce the human effort required by formal verification is to modify general purpose theorem proving techniques to increase the number of lemma instances considered automatically Such a modification to the forward chaining proof technique within the ACL2 theorem prover is described This dissertation identifies a decidable subclass of the ACL2 logic the Subclass of Unrollable List Formulas in ACL2 SUFLA SUFLA is shown to be decidable i e there exists an algorithm that decides whether any SUFLA formula is valid Theorems from first order logic can be proven through a methodology that combines interactive theorem proving with a fully automated solver for SUFLA formulas This methodology has been applied to the verification of components of the TRIPS processor a prototype processor designed and fabricated by the University of Texas and IBM Also a fully automated procedure for the Satisfiability Modulo Theory SMT of bit vectors is implemented by combining a solver for SUFLA formulas with the ACL2 theorem prover's general purpose rewriting proof technique A new methodology for combining theorem proving and model checking is presented which uses a unique black box formalization of hardware designs This methodology has been used to combine the ACL2 theorem prover with IBM's SixthSense model checker and applied to the verification of a high performance industrial multiplier design A general purpose mechanism has been created for adding external tools to a general purpose theorem prover This mechanism implemented in the ACL2 theorem prover is capable of supporting the combination of ACL2 with both SixthSense and the SAT based SUFLA solver A new hardware

description language DE2 is described DE2 has a number of unique features geared towards simplifying formal verification including a relatively simple formal semantics support for the description of circuit generators and support for embedding non functional constructs within a hardware design The composition of these techniques extend our knowledge of the languages and logics needed for formal verification and should reduce the human effort required to verify large hardware circuit models

Advanced Techniques for Assertion-Based Verification in Hardware Designs Using Data Mining Algorithms  
Mohammad Reza Heidari Iman,2025-08-02 This book introduces leading edge techniques for verifying the complex electronic systems used in industries such as aerospace automotive and medical devices and ensuring the safety and security of these systems By focusing on advanced verification and security verification methods the author addresses the critical need to detect and prevent potential bugs errors and vulnerabilities such as Hardware Trojans in embedded systems With an emphasis on innovative approaches to assertion based verification this book provides valuable insights for engineers researchers and professionals dedicated to enhancing the functional verification security and trustworthiness of critical technological systems The methods described in this book address key shortcomings in current automatic assertion miners used for assertion based verification such as long execution times excessive and redundant assertion generation and inconsistency among generated assertions The author discusses several innovative methods tools and techniques such as ARTmine IMMizer and Dominance which enhance functional verification and facilitate the automatic generation evaluation and minimization of assertions Additionally novel techniques are introduced for security verification including a security based assertion miner for RISC V processors and ADAssure for debugging and bug localization in autonomous driving control algorithms of autonomous vehicles
