Geotechnical Engineering of Landfills Neil Dixon, E J Murray, D R V Jones, 1998-04-08 These proceedings cover a range of issues of direct relevance to geotechnical engineers and associated

disciplines working on landfill design highlight new areas of research and practice and provide a focus for future research and development

HDPE Geomembranes in Geotechnics Werner W. Müller, 2006-11-24 HDPE High density polyethylene geomembranes are nowadays widely used for large area liners and construction sealings in geotechnical engineering Lining of water ponds dams and dykes landfill base liners and cover systems remediation of contaminated sites waterproof for tunnels beneath highways and for various other civil engineering constructions are a few examples of application The book covers all aspects of the HDPE geomembrane field HDPE materials geomembrane manufacture textured geomembranes properties long term performance and testing installation and welding of geomembranes quality assurance and control leak detection standards recommendations and regulations Various important topics are treated in detail As part of it the basic physical and chemical facts necessary to fully understand HDPE geomembrane properties and performance are carefully developed and explained The book may therefore serve as a true handbook for manufacturers designers testing and inspection engineers and consultants and representatives of responsible administrations giving all relevant facts for appropriate design manufacture and installation testing and assessment of performance Parts of it may also be used as textbook for lectures or seminars on geosynthetics and geotechnical or geoenvironmental engineering with geosynthetics in faculties of materials science and civil engineering

Assessment of the Performance of Engineered Waste Containment Barriers National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee to Assess the Performance of Engineered Barriers, 2007-08-22 President Carter's 1980 declaration of a state of emergency at Love Canal New York recognized that residents health had been affected by nearby chemical waste sites The Resource Conservation and Recovery Act enacted in 1976 ushered in a new era of waste management disposal designed to protect the public from harm It required that modern waste containment systems use engineered barriers designed to isolate hazardous and toxic wastes and prevent them from seeping into the environment These containment systems are now employed at thousands of waste sites around the United States and their effectiveness must be continually monitored Assessment of the Performance of Engineered Waste Containment Barriers assesses the performance of waste containment barriers to date Existing data suggest that waste containment systems with liners and covers when constructed and maintained in accordance with current regulations are performing well thus far However they have not been in existence long enough to assess long term postclosure performance which may extend for hundreds of years The book makes recommendations on how to improve future assessments and increase confidence in predictions of barrier system performance which will be of interest to policy makers environmental interest groups industrial waste producers and industrial waste management industry

Geosynthetics in Civil Engineering R W Sarsby, 2006-12-22 Geosynthetics are man made polymer based materials which facilitate cost effective building environmental transportation and other construction projects Given their versatility geosynthetics are a vital material in all aspects of civil engineering The first section of the book covers the

fundamentals of geosynthetics Chapters discuss the design and durability of geosynthetics together with their material properties and international standards governing their use Building on these foundations part two examines the various applications of geosynthetics in areas such as filters separators landfills barriers and foundation materials The book concludes by reviewing methods of quality assurance and the service life of geosynthetics Written by an international team of contributors Geosynthetics in civil engineering is an essential reference to all those involved in civil engineering Discusses the fundamentals of geosynthetics Examines various applications in areas such as filters separators landfills and foundation materials Reviews quality assurance and the service life of geosynthetics

The Exploitation of Natural Resources and the Consequences R. W. Sarsby, T. Meggyes, 2001 As the pressure to conserve agricultural land and green field sites has grown it has become increasingly important to reclaim land that has been damaged by past industrial usage e.g. areas of mining subsidence tailings dams and lagoons Furthermore the need to conserve primary aggregates is providing an impetus for re use of waste materials in engineered construction This book is the proceedings of the GREEN3 the third in a four yearly series of international symposia that discuss aspects of geotechnical engineering intimately related to the environment

Construction for a Sustainable Environment Robert Sarsby, Tamas Meggyes, 2009-11-03 The past fifty years have seen rapid development of public and governmental awareness of environmental issues Engineers and scientists have made tangible contributions to environmental protection However further theoretical and practical developments are necessary to address mankind's growing demands on the environment

Construction for a Sustainable Environment Hanuman Devidas Chalak, Ashwani Jain, Praveen Aggarwal, 2026-01-01 This book encompasses economic social and environmental dimensions aiming for a balance that ensures the well being of both people and the planet over the long term Sustainability and environmental protection are crucial topics in today's world Sustainability refers to the ability to meet the needs of the present without compromising the ability of future generations to meet their own needs Addressing these issues requires collaboration innovation and a commitment to change at all levels of society By prioritizing sustainability and environmental protection we can work toward a healthier more equitable and more resilient future for all Sustainability of a system is its ability to survive and retain its functionality over time For an engineered system to be sustainable it should be efficient reliable resilient and adaptive Thus the objective of sustainable engineering is to ensure the integration of an engineered system into the natural and man made environment without compromising the functionality of either the engineered system or that of the ecosystem and society and this harmony between the natural and built environments must be maintained at the local regional and global scales Therefore in the engineering domain sustainability can be looked upon as a dynamic equilibrium between four E's engineering design economy environment and equity As climate change and resource scarcity continue to pose major challenges there is an urgent need for more sustainable solutions in construction industry In response to these challenges the construction industry

is actively exploring and implementing more sustainable practices and materials This shift aims to reduce the environmental impact of material production extend the service life of structures and minimize resource consumption Researchers industry professionals and policymakers are collaborating to develop and promote innovative technologies materials and strategies that can significantly reduce the carbon footprint energy use and waste generation associated with construction
