[Independent Component Analysis](#) Stephen Roberts, Richard Everson, 2001-03 Independent Component Analysis ICA has recently become an important tool for modelling and

understanding empirical datasets It is a method of separating out independent sources from linearly mixed data and belongs to the class of general linear models ICA provides a better decomposition than other well known models such as principal component analysis This self contained book contains a structured series of edited papers by leading researchers in the field including an extensive introduction to ICA The major theoretical bases are reviewed from a modern perspective current developments are surveyed and many case studies of applications are described in detail The latter include biomedical examples signal and image denoising and mobile communications ICA is discussed in the framework of general linear models but also in comparison with other paradigms such as neural network and graphical modelling methods The book is ideal for researchers and graduate students in the field

Independent Component Analysis Te-Won Lee,2013-04-17 Independent Component Analysis ICA is a signal processing method to extract independent sources given only observed data that are mixtures of the unknown sources Recently blind source separation by ICA has received considerable attention because of its potential signal processing applications such as speech enhancement systems telecommunications medical signal processing and several data mining issues This book presents theories and applications of ICA and includes invaluable examples of several real world applications Based on theories in probabilistic models information theory and artificial neural networks several unsupervised learning algorithms are presented that can perform ICA The seemingly different theories such as infomax maximum likelihood estimation negentropy maximization nonlinear PCA Bussgang algorithm and cumulant based methods are reviewed and put in an information theoretic framework to unify several lines of ICA research An algorithm is presented that is able to blindly separate mixed signals with sub and super Gaussian source distributions The learning algorithms can be extended to filter systems which allows the separation of voices recorded in a real environment cocktail party problem The ICA algorithm has been successfully applied to many biomedical signal processing problems such as the analysis of electroencephalographic data and functional magnetic resonance imaging data ICA applied to images results in independent image components that can be used as features in pattern classification problems such as visual lip reading and face recognition systems The ICA algorithm can furthermore be embedded in an expectation maximization framework for unsupervised classification Independent Component Analysis Theory and Applications is the first book to successfully address this fairly new and generally applicable method of blind source separation It is essential reading for researchers and practitioners with an interest in ICA

Independent Component Analysis and Blind Signal Separation Carlos G. Puntonet, Alberto Prieto, 2004-10-27

In many situations found both in Nature and in human built systems a set of mixed signals is observed frequently also with noise and it is of great scientific and technological relevance to be able to isolate or separate them so that the information in each of the signals can be utilized

Blind source separation BSS research is one of the more interesting emerging fields now a days in the field of signal processing It deals with the algorithms that allow the recovery of the original sources from a set of mixtures only

The adjective blind is applied because the purpose is to estimate the original sources without any a priori knowledge about either the sources or the mixing system

Most of the models employed in BSS assume the hypothesis about the independence of the original sources

Under this hypothesis a BSS problem can be considered as a particular case of independent component analysis ICA a linear transformation technique that starting from a multivariate representation of the data minimizes the statistical dependence between the components of the representation

It can be claimed that most of the advances in ICA have been motivated by the search for solutions to the BSS problem and the other way around advances in ICA have been immediately applied to BSS

ICA and BSS algorithms start from a mixture model whose parameters are estimated from the observed mixtures

Separation is achieved by applying the inverse mixture model to the observed signals

Separating or unmixing model

Mixture models usually fall into three broad categories instantaneous linear models convolutive models and nonlinear models the first being the simplest but in general not near realistic applications

The development and test of the algorithms can be accomplished through synthetic data or with real world data

Obviously the most important aim and most difficult is the separation of real world mixtures

BSS and ICA have strong relations also apart from signal processing with other fields such as statistics and artificial neural networks

As long as we can find a system that emits signals propagated through a medium and those signals are received by a set of sensors and there is an interest in recovering the original sources we have a potential field of application for BSS and ICA

Inside that wide range of applications we can find for instance noise reduction applications biomedical applications audio systems telecommunications and many others

This volume comes out just 20 years after the first contributions in ICA and BSS appeared

Therein after the number of research groups working in ICA and BSS has been constantly growing so that nowadays we can estimate that far more than 100 groups are researching in these fields

As proof of the recognition among the scientific community of ICA and BSS developments there have been numerous special sessions and special issues in several well known journals
