**Advances in Sonochemistry** T.J. Mason,A. Tiehm,2001-06-22 Ultrasound in Environmental Protection focuses on one of the more significant developments in the subject environmental remediation providing an overview on both the fundamentals and applications of ultrasound in environmental protection incorporating recent research and state of the art information on the scientific basis modes of use and engineering developments A broad spectrum of topics are covered reactor design sonochemical pollutant degradation integrated ultrasonic biological treatment ultrasound in disinfection leaching by ultrasound and ultrasonically enhanced removal of suspended solids Ultrasound is generated and applied at frequencies from 20 kHz to several MHz The physio chemical parameters of the sonicated media reactor design applied intensity and duration of sonication dramatically influence the effects that can be achieved It is hoped that this compilation will contribute to a better understanding and further development of sonochemistry as a clean technology not only for environmental remediation but also more generally The foundation of this compilation was formed during a workshop that was held at the Technical University of Hamburg Harburg Germany in March 1999 This was the first workshop to be devoted to Ultrasound in Environmental Engineering and brought together experience and knowledge from a broad spectrum of disciplines including chemistry biology engineering equipment manufacturing and plant design

*Applied Sonochemistry* T. J. Mason,John P. Lorimer,2002-05-06 Power ultrasound has been used for many years in two specific industrial areas cleaning and plastic welding Over the last ten years an increasing interest has been shown in its potential for use over a much wider range of chemistry and processing which has been grouped together under

the general title of sonochemistry Most of these uses depend on the generation of acoustic cavitation in liquid media but this text while underlining the importance of the physics and mathematics of cavitation mainly concentrates on applications of the technology After an introduction to the topic and some historical background to the uses of power ultrasound the general principles of acoustic cavitation are explored including some background physics bubble dynamics and factors which influence cavitation The remainder of the book incorporates a series of applications of sonochemistry which illustrate the types of physical and chemical effects of ultrasonically induced cavitation which will interest chemists and engineers alike Amongst the major topics included are chemical synthesis environmental protection and remediation of water sewage and soils polymer synthesis and processing electrochemistry including both analytical and synthetic aspects and plating The final chapter reviews the range of ultrasonic equipment available in the laboratory and the progress made towards the scale up of sonochemistry The level is introductory to semi advanced and no topic has been taken to a particularly specialist level since it is intended that this should be of general interest to readers with a scientific background
