Advances In Temporal Logic:

Advances in Temporal Logic Howard Barringer, Michael Fisher, Dov M. Gabbay, Graham Gough, 2013-11-11 Time is a fascinating subject and has long since captured mankind's imagination from the ancients to modern man both adult and child alike. It has been studied across a wide range of disciplines from the natural sciences to philosophy and logic. Today, thirty plus years since Prior's work in laying out foundations for temporal logic and two decades on from Pnueli's seminal work applying of temporal logic in specification and verification of computer programs, temporal logic has a strong and thriving international research community within the broad disciplines of computer science and artificial intelligence. Areas of activity include but are certainly not restricted to Pure Temporal Logic e.g. temporal systems proof theory, model theory, expressiveness and complexity issues, algebraic properties, application of game theory, Specification and Verification e.g. of reactive systems, of real time components of user interaction of hardware systems, techniques and tools for verification, execution and prototyping methods, Temporal Databases e.g. temporal representation, temporal querying, granularity of time, update mechanisms, active temporal data bases, hypothetical reasoning, Temporal Aspects in AI e.g. modelling temporal phenomena in terval, temporal calculi, temporal nonmonotonicity, interaction of temporal reasoning with action knowledge, belief logics, temporal planning, Tense and Aspect in Natural Language e.g. models, ontologies, temporal quantifiers, connectives, prepositions, processing tempo ral statements, Temporal Theorem Proving e.g. translation methods, clausal and non clausal resolution, tableaux, automata, theoretic approaches, tools and practical systems.

Advances in Verification of Time Petri Nets and Timed Automata Wojciech Penczek, Agata Pólrola, 2007-03-06 This monograph presents a comprehensive introduction to timed automata (TA) and time Petri nets (TPNs) which belong to the most widely used models of real time systems. Some of the existing methods of translating time Petri nets to timed automata are presented with a focus on the translations that correspond to the semantics of time Petri nets, associating clocks with various components of the nets.

Advances in Chance Discovery Yukio Ohsawa, Akinori Abe, 2012-08-01 Since year 2000 scientists on artificial and natural intelligences started to study chance discovery methods for discovering events situations that significantly affect decision making. Partially because the editors Ohsawa and Abe are teaching at schools of Engineering and of Literature with sharing the interest in chance discovery, this book reflects interdisciplinary aspects of progress. First as an interdisciplinary melting pot of cognitive science, computational intelligence, data mining, visualization, collective intelligence, etc. chance discovery came to reach new application domains e.g. health care, aircraft control, energy plant management of technologies, product designs, innovations, marketing, finance, etc. Second, basic technologies and sciences including sensor technologies, medical sciences, communication technologies, etc. joined this field and interacted with cognitive computational scientists in workshops on chance discovery to obtain breakthroughs by stimulating each other. Third, time came to be introduced explicitly as a significant variable, ruling causalities, background situations causing chances and chances causing impacts on

events and actions of humans in the future Readers may urge us to list the fourth fifth sixth but let us stop here and open this book
