Frisch,Daniel Klemptner,2020-01-16 Flexible polyurethane foams of all types are a unique group of plastics materials characterized by the fact that a multitude of different sets of properties can be obtained by varying the levels of a relatively small number of base components in the formulations Different foam grades primarily characterized by density and hardness can be obtained by changing the ratio between base polyol polymer polyol water blowing agent isocyanate and other components It is not uncommon for foam producers in industrialized countries to manufacture more than one hundred different foam grades based on these basic chemicals plus the ancillary chemicals needed for optimized processing This has always made flexible polyurethane foams a highly suitable candidate for correlating these variations in the formulations with the resulting properties in a mathematical way aimed at predicting the properties as accurately as possible fine tuning existing grades or designing new foam grades This book discusses the methodology for obtaining meaningful equations for correlating properties with formulation variables and other influencing factors      **Advances in urethane science and technology** University of Detroit,Polymer Conference Series,      *Advances in Urethane Science and Technology* University of Detroit,1974      Advances in Urethane Science and Technology ,1978      **Advances in Urethane Science and Technology** ,1977      **Advances in Urethane** Kurt C.
