Pathogenic Mechanisms and New Technology-Based Diagnostics for Bacterial Infections
Hua Wang, Chao He, Yao Liu, 2026-01-22 Respiratory infections are caused by pathogenic microorganisms invading the respiratory system and are divided into upper respiratory tract and lower respiratory tract infections Among them upper respiratory tract infections caused by viruses have a higher incidence rate throughout the year while lower respiratory tract infections are one of the highly fatal infectious diseases worldwide Therefore respiratory infections are one of the major challenges facing global public health The rapid and accurate pathogen detection using cutting edge biotechnology is key to the effective diagnosis and treatment of respiratory system diseases and further research on pathogen transmission infection and pathogenic mechanisms using these technologies is of great significance in establishing new prevention and control measures As technology continues to evolve the diagnostic landscape for bacterial infections is poised for significant changes in the future Pathogenic mechanisms of bacterial infections include invasion adherence evasion of the immune system and immunity evasion and toxin production Understanding pathogenic mechanisms and integrating new technologies in diagnostics is critical for public health This Research Topic is dedicated to exploring the mechanisms and diagnostics of respiratory pathogens infections with an emphasis on embracing pioneering new technology based methods or significant improvements in existing technologies It covers the infection mechanisms of respiratory viruses and the developments in microfluidics lab on a chip technologies and mobile health apps that facilitate the creation of portable user friendly and affordable diagnostic tools for respiratory pathogen infections This overview includes the applications of cutting edge scientific technologies in exploring the epidemiology of respiratory pathogens pathogenic mechanisms transmission mechanisms prevention and control and other related aspects including microorganisms and human immunity We welcome submissions focusing on but not limited to the following subtopics The detection methods for the respiratory pathogens Establishment of new methods for the simultaneous detection of multiple pathogens while outperforming existing methods in one way or another Significant improvements in the detection of single respiratory pathogens including improvements in operational procedures integration and assay performance Combining multiple technologies to achieve superior assay performance e.g. combining microfluidics and CRISPR Cas systems with molecular biology methods Clearly define the sensitivity specificity positive predictive value PPV and negative predictive value NPV of new methods for detecting respiratory pathogens

Filamentous Bacteriophage in Bio/Nano/Technology, Bacterial Pathogenesis and Ecology Jasna Rakonjac,Bhabatosh Das,Ratmir Derda,2017-02-16
Filamentous phage genus Inovirus infect almost invariably Gram negative bacteria They are distinguished from all other bacteriophage not only by morphology but also by the mode of their assembly a secretion like process that does not kill the host Classic Escherichia colifilamentous phage Ff f1 fd and M13 are used in display technology and bio nano technology whereas filamentous phage in general have been put to use by their bacterial hosts for adaptation to environment pathogenesis biofilm formation horizontal gene transfer and modulating genome stability Many filamentous phage have a symbiotic life style that is often manifested by inability to form plaques preventing their identification by standard phage hunting techniques while the absence or very low sequence conservation between phage infecting different species often complicates their identification through bioinformatics Nevertheless the number of discovered filamentous phage is increasing rapidly along with realization of their significance Temperate filamentous phage whose genomes are integrated into the bacterial chromosome of pathogenic bacteria often modulate virulence of the host The Vibrio cholerae phage CTXf genome encodes cholera toxin whereas many filamentous prophage influence virulence without encoding virulence factors The nature of their effect on the bacterial pathogenicity and overall physiology is the next frontier in understanding intricate relationship between the filamentous phage and their hosts Phage display has been widely used as a combinatorial technology of choice for discovery of therapeutic antibodies and peptide leads that have been applied in the vaccine design diagnostics and drug development or targeting over the past thirty years Virion proteins of filamentous phage are integral membrane proteins prior to assembly hence they are ideal for display of bacterial surface and secreted proteins The use of this technology at the scale of microbial community has potential to identify host interacting proteins of uncultivable or low represented community members Recent applications of Ff filamentous phage extend into protein evolution synthetic biology and nanotechnology In many applications phage serves as a monodisperse long aspect nano scaffold of well defined shape Chemical or chenetic modifications of this scaffold are used to introduce the necessary functionalities such as fluorescent

labels ligands that target specific proteins or peptides that promote formation of inorganic or organic nanostructures We anticipate that the future holds development of new strategies for particle assembly site specific multi functional modifications and improvement of existing modification strategies These improvements will render the production of filamentous phage templated materials safe and affordable allowing their applications outside of the laboratory
