Capacity Planning For Internet Services:

Capacity Planning for Internet Services Adrian Cockcroft,2001 **The Art of Capacity Planning** Arun Kejariwal,John Allspaw,2017-09-21 In their early days Twitter Flickr Etsy and many other companies experienced sudden spikes in activity that took their web services down in minutes Today determining how much capacity you need for handling traffic surges is still a common frustration of operations engineers and software developers This hands on guide provides the knowledge and tools you need to measure deploy and manage your web application infrastructure before you experience explosive growth In this thoroughly updated edition authors Arun Kejariwal MZ and John Allspaw provide a systematic robust and practical approach to capacity planning rather than theoretical models based on their own experiences and those of many colleagues in the industry They address the vast sea change in web operations especially cloud computing Understand issues that arise on heavily trafficked websites or mobile apps Explore how capacity fits into web mobile app availability and performance Use tools for measuring and monitoring computer performance and usage Turn measurement data into robust forecasts and learn how trending fits into the planning process Examine related deployment concepts installation configuration and management automation Learn how cloud autoscaling enables you to scale your app s capacity up or down

Scalable and Secure Internet Services and Architecture Cheng-Zhong Xu,2005-06-10 Scalable and Secure Internet Services and Architecture provides an in depth analysis of many key scaling technologies Topics include server clusters and load balancing QoS aware resource management server capacity planning Web caching and prefetching P2P overlay network mobile code and security and mobility support for adaptive grid computi **A Spare Capacity Planning Methodology for Wide Area Survivable Networks** Adel A. Al-Rumaih,1999 In this dissertation a new spare capacity planning methodology is proposed utilizing path restoration The approach is based on forcing working flows traffic which are on paths that are disjoint to share spare backup capacity The algorithm for determining the spare capacity assignment is based on genetic algorithms and is capable of incorporating non linear variables such as non linear cost function and QoS variables into the objective and constraints The proposed methodology applies to a wider range of fault scenarios than most of the current literature It can tolerate link failures node failures and link and node failures It consists of two stages the first stage generates a set of network topologies that maximize the sharing between backup paths by forcing them to use a subset of the original network The second stage utilizes a genetic algorithm to optimize the set of solutions generated by the first stage to achieve an even better final solution It can optimize the solution based on either minimizing spare capacity or minimizing the total network cost In addition it can incorporate QoS variables in both the objective and constraints to design a survivable network that satisfies QoS constraints Numerical results comparing the proposed methodology to Integer Programming techniques and heuristics from the literature are presented showing the advantages of the technique The proposed methodology was applied on 4 different size networks based on spare capacity optimization criteria and it was found that it

achieved solutions that were on average 9.3% better than the optimal solution of the IP design that is based on link restoration. It also achieved solutions that were on average 22.2% better than the previous heuristic SLPA. The proposed methodology is very scalable. It was applied on networks with different sizes ranging from a 13 node network to a 70 node network. It was able to solve the 70 node network in less than one hour on a Pentium II PC. The curve fitting of the empirical execution time of the methodology was found to be $O(n^3)$.
