Capillary Electrochromatography:

Capillary Electrochromatography F. Svec, Z. Deyl, 2001-03-14 This book discusses the evolution and uses for capillary electrochromatography as a new dimension to current separation science. With the emergence of this technique, the selection of available separation mechanisms increases dramatically. The book also discusses the new horizons in the separation of non-polar compounds which have been opened as a result of CEC. Over ten chapters, authors cover a wide variety of topics and provide the reader with necessary theoretical background, description of the instrumentation, modes of operation, and methods of detection, and an overview of the broad variety of applications of capillary electrochromatography. Bartle, Peter Myers, 2001 Capillary electrochromatography (CEC) is a new and exciting hybrid separation technique that seeks to exploit the combined advantages of both capillary electrophoresis (high efficiencies) and HPLC (mobile and stationary phase selectivity). It is a technique with tremendous potential, especially in the pharmaceutical and biomedical fields. This is the first book to be devoted to the topic and presents reviews by the world leaders in the field on the theory and development of the technique and current and potential future applications. Capillary Electrochromatography provides an excellent introduction to the field for graduates and professionals in industry and academia with an interest in separation science. part of the RSC Chromatography Monographs series *Capillary Electrophoresis* Philippe Schmitt-Kopplin, 2008-02-25 This book presents a selection of current capillary electrophoresis methods used to separate representative types of molecules and particles and in combination with different detection techniques. It includes practical details which are hard to find elsewhere. The volume is intended for beginners in the field and provides an overview of the technique and a starting point for the exploration of the defined literature on different application topics **Liquid Chromatography** A. Rocco, G. D'Orazio, Z. Aturki, S. Fanali, 2013-01-08 Capillary electrochromatography (CEC) is one of the recently developed miniaturized analytical techniques. The separation mechanism involved in the separation process is based mainly on the analyte-stationary/mobile phase interactions; however, in the case of charged compounds, the different electrophoretic mobilities have to be considered. The process takes place in a capillary column containing a selected stationary phase where the mobile phase is delivered by an electroosmotic flow (EOF) controlled by the application of a relatively high electric field. In contrast to what happens in liquid chromatography where the mobile phase possesses a parabolic profile, in CEC a plug flow profile is observed that helps achieve a higher efficiency. This overview includes the illustration of basic principles of CEC, the latest achievements concerning the instrumentation used (stationary phases, columns, detectors), hyphenation, description of method optimization, selected examples, and some potential uses of CEC in separation science. *Practical Capillary Electrophoresis* Robert Weinberger, 2000-04-18 In the 1980s, capillary electrophoresis (CE) joined high performance liquid chromatography (HPLC) as the most powerful separation technique available to analytical chemists and biochemists. Published research using CE grew

from 48 papers in the year of commercial introduction 1988 to 1200 in 1997 While only a dozen major pharmaceutical and biotech companies have reduced CE to routine practice the applications market is showing real or potential growth in key areas particularly in the DNA marketplace for genomic mapping and forensic identification For drug development involving small molecules including chiral separations one CE instrument can replace 10 liquid chromatographs in terms of speed of analysis CE also uses aqueous rather than organic solvents and is thus environmentally friendlier than HPLC The second edition of Practical Capillary Electrophoresis has been extensively reorganized and rewritten to reflect modern usage in the field with an emphasis on commercially available apparatus and reagents This authoritative and very comprehensible treatment builds on the author s extensive experience as an instructor of short courses for the American Chemical Society and for industry Illustrated with detailed diagrams of electrophoretic phenomena Offers step by step methods development schemes Presents techniques for developing quantitative robust and precise methods Includes an extensive troubleshooting guide Updates and greatly expands on the first edition more than 50% of the text is new Written by an internationally recognized scientist who is an instructor for American Chemical Society short courses on HPCE

Novel Concepts and Techniques in Capillary Electrochromatography Chadin Kulsing, 2015 Capillary electrochromatography CEC has been realised as a combination of highperformance liquid chromatography HPLC and capillary electrophoresis CE allowing theseparation of analytes based on their differing adsorption and migration behaviour There is a considerable interest in developing new methodologies for CEC which uses chromatographic beads or monoliths as stationary phases or alternatively employs open tubular OT capillaries relying on surface modifications Besides the bulk flat flow profile of the mobile phase in CEC columns allowing an enhanced resolution

due to the influence of the applied electrical field there are other possibilities to provide a higher resolution with better detection. As an additional new means for peak sharpening and sample enrichment isotachopheresis and a sweeping mechanism could be envisaged which both take advantage of the inhomogeneous electric field pattern in the capillary by choosing appropriate leading and terminating background electrolytes (BGEs). Transient isotachopheresis would be another technique to provide an increased plate height in the separations using an optimized sample matrix e.g. containing a relatively high acetonitrile content with the same leading and terminating BGEs. In this thesis a new method to generate a sharpening zone which is similar to the concept of transient isotachopheresis was established using an aqueous sample matrix containing an organic solvent. Target analytes within this zone could be concentrated whilst they migrated through the capillary. A novel technique was developed that used the sharpening zone for sweeping and concentrating several unresolved analyte peaks allowing an enhanced peak resolution. As the aim was to concentrate only some part of the analyte zone containing compounds of interest the position and width of the sharpening zone needed to be well controlled. Various techniques to tune the width and position of the sharpening zone were thus developed involving modifying the organic modifier content in the BGE, applying pressure additionally to the electroosmotic flow (EOF) and modifying the inner surface of the capillaries. This work also critically evaluated some related existing knowledge and theoretical approaches in CEC including the concept of tuneable system eigenpeaks (non-migrating or ghost peaks) caused by waves of an electric field in the capillary. Although peak broadening caused by eigenpeaks which often suppresses resolution in CEC has been well described for aqueous or pure non-aqueous BGEs a systematic study of eigenmobility in aqueous acetonitrile BGEs had not been reported. The experiments related to the eigenmobility led to a new approach to tune the eigenpeak position in chromatograms whereby a selective sample peak sharpening mechanism was elaborated using the sharpening zone. The novel approach was demonstrated for the separation of various peptides in the CE mode and for the resolution of incompletely resolved chiral amino acids in CEC. These investigations furthermore led to the development of an appropriate stationary phase which was produced using techniques for an in-column synthesis of a molecularly imprinted polymer (MIP). Well-prepared MIPs are capable of specifically enhancing the retention of target analytes herein focusing on enantioselective isolation of chiral molecules. Since such a MIP was rather rigid which often caused capillary clogging when used as a conventional monolithic stationary phase this MIP was incorporated into porous layer open tubular (PLOT) capillaries. Numerous experimental difficulties were overcome with respect to the vinylisation of long fused silica capillaries and for the polymerisation of the MIP within using thermal and photo-polymerisations. A method for the characterization of such MIP PLOT capillaries was elaborated involving the Langmuir adsorption theory. The new columns were evaluated using chromatography, scanning electron microscopy (SEM), energy dispersive X-ray spectroscopy (EDX) and CEC analysis. All experiments were designed according to the principles of Green Chemistry. These concepts involved the use of small scale

analysis simulation studies reducing the number of performed experiments systematic studies with low amounts of solvents and materials and optimisation of synthesis methods to reduce time energy and reagent consumption The theories methods and results presented in this thesis will in the future allow further targeted developments of novel analytical tools for a green sensitive selective and improved resolution analysis of chemical and biological compounds including chiral compounds peptides and proteins
