**On Quality Improvement in Gynaecological Cancer Surgery** Evelyn Serreyn Lundin, 2019-12-10 Objectives The overall purpose of this thesis was to find medical and surgical treatment methods of improving the perioperative care of gynaecological cancer patients The specific objectives were to determine whether a single dose tranexamic acid given immediately before surgery for presumed advanced ovarian cancer reduces perioperative blood loss and the need for blood transfusions and to determine whether postoperative recovery tissue damage and inflammatory response markers differ between women operated with robotic and abdominal hysterectomy for low risk endometrial cancer in an enhanced recovery after surgery ERAS programme and to evaluate costs for hospital stay and postoperative recovery in relation to health impact Material and Methods The thesis was based on two randomised trials The first trial was a randomised double blind placebo controlled multicentre study conducted in four hospitals in the southeast and central of Sweden between March 2008 and May 2012 One hundred women with presumed advanced ovarian cancer who had been scheduled for radical debulking surgery were included 50 received tranexamic acid and 50 received a placebo The main outcomes were blood loss and red blood cell transfusions The second trial was a randomised open single centre trial at a Swedish university hospital which included 50 women with low risk endometrial cancer scheduled for radical surgery between February 2012 and May 2016 25 women underwent robotic hysterectomy and 25 had abdominal hysterectomy Anaesthesia and perioperative care followed an ERAS protocol in both groups The EuroQol Group form EQ 5D 3L and the Short Form 36 evaluated the health related quality of life The Swedish Postoperative Symptoms Questionnaire assessed symptoms perioperatively until six weeks postoperatively Venous blood samples were collected on several occasions until six weeks postoperatively and were analysed for markers reflecting inflammatory response and tissue damage In addition a health economic evaluation was conducted comparing total costs qualityadjusted life years QALYs and cost per QALY between the surgical methods Results Total blood loss volume and transfusion rate following surgery in advanced ovarian cancer were significantly lower in the tranexamic group compared with the placebo group Women with early

endometrial cancer treated by robotic hysterectomy recovered significantly faster in the EQ 5D health index and reached their preoperative level nearly two weeks earlier than the abdominal group Differences regarding improvement in health related quality of life Short Form 36 comprising general health and social functioning were more favourable in the robotic hysterectomy group Consumption of analgesics pain intensity postoperative symptom sum score and length of hospital stay were equal between the groups The occurrence of complications was an independent risk factor and influenced most of the outcome measures adversely Postoperative inflammatory response and tissue damage were lower after robotic hysterectomy compared with the abdominal approach The robotic group gained more QALYs until six weeks after surgery than the abdominal group but the total costs were higher The total cost per QALY gained was quite high for the robotic procedure Conclusions A single dose of tranexamic acid given immediately before surgery reduces blood loss and transfusion rates in advanced ovarian cancer surgery Robotic hysterectomy in an ERAS programme treating early endometrial cancer leads to a faster recovery in the health related quality of life than abdominal hysterectomy the latter being strongly influenced by perioperative complications Less tissue damage and inflammation might contribute to a faster recovery in the robotic group Robotic hysterectomy provides more QALYs until six weeks postoperatively but with a substantially higher total cost for the society
