Project Title: Chloramine Decomposition in Distribution System and Model Waters_____

Project Number: 937_____

Principal Investigator: Richard L. Valentine, University of Iowa

Objectives:

(State the relevant objectives of the project; 75 words or less.)

This study was designed to contribute to a better understanding of the fate of chloramines in distribution systems. The project objectives were to: 1) characterize the influence of water quality parameters on chloramine decomposition rates; 2) evaluate and compare chloramine decomposition rates in distribution system water with rates determined in model systems; 3) characterize the nature of chloramine decomposition products; 4) perform mass and redox balances that include all known nitrogen-containing and chlorine-containing products, and; 5) develop mathematical relationships and models of use to describing the rate of chloramine loss in drinking water.

Background:

(Provide background information; 75 words or less.)

Chloramines, produced by a reaction between free chlorine and ammonia in a process called chloramination, have long been used to provide a disinfecting residual in distribution systems where it is difficult to maintain a free chlorine residual. More recently chloramines have been used to replace free chlorine because they are believed to produce fewer disinfection by-products (DBPs). The U.S. Environmental Protection Agency has promulgated a maximum contaminant level (MCL) of 4.0 mg/L as Cl_2 . Although chloramines are generally believed to be less reactive than free chlorine, they are unstable, even in the absence of organic matter, and they disappear slowly. To meet DBP and disinfection objectives, it is desirable that the chloramine residual be as stable as possible. In spite of a long history of use, the fate of chloramines in distribution systems and the characteristics and processes that influence their stability are largely unknown.

Highlights:

(Provide "at a glance" the main findings of the research [minimum of three]; 100 words or less.)

This research developed both a sophisticated model that mechanistically describes monochloramine decay and a simplified model that can be used to determine the theoretical stability of monochloramine for a

Drinking Water Distribution Systems National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on Public Water Supply Distribution Systems: Assessing and Reducing Risks, 2007-01-22 Protecting and maintaining water distributions systems is crucial to ensuring high quality drinking water Distribution systems consisting of pipes pumps valves storage tanks reservoirs meters fittings and other hydraulic appurtenances carry drinking water from a centralized treatment plant or well supplies to consumers taps Spanning almost 1 million miles in the United States distribution systems represent the vast majority of physical infrastructure for water supplies and thus constitute the primary management challenge from both an operational and public health standpoint Recent data on waterborne disease outbreaks suggest that distribution systems remain a source of contamination that has yet to be fully addressed This report evaluates approaches for risk characterization and recent data and it identifies a variety of strategies that could be considered to reduce the risks posed by water quality deteriorating events in distribution systems Particular attention is given to backflow events via cross connections the potential for contamination of the distribution system during construction and repair activities maintenance of storage facilities and the role of premise plumbing in public health risk The report also identifies advances in detection monitoring and modeling analytical methods and research and development opportunities that will enable the water supply industry to further reduce risks associated with drinking water distribution systems

Optimizing Chloramine Treatment Gregory J. Kirmeyer, 2004 This manual recommends optimal operational criteria for chloramine application to enhance and protect distribution system water quality It examines the chemical characteristics of chloramines documents the use of chloramines with case studies and provides planning design startup and monitoring strategies for optimizing the use of chloramines

Control of Disinfection By-products in Drinking Water Systems Anastasia Nikolau, Luigi Rizzo, Hüseyin Selcuk, 2007 The occurrence of disinfection by products

DBPs in drinking water has been an issue of major concern during several decades The formation of many DBPs species during water disinfection has been documented while new by products are still being detected as the analytical instrumentation available becomes more accurate and sensitive Most of the DBPs have been proven to have toxic effects on living organisms therefore they pose risks to human health during drinking water consumption The factors affecting their formation have been extensively investigated their transport and fate have been studied modelling efforts for several of them have been performed in order to understand better their behaviour and therefore try to minimise their occurrence in waters Techniques for their removal from water have also been applied and a variety of disinfection methods or combinations of disinfecting agents have been investigated with the aim to produce safe drinking water containing the minimum possible concentrations of DBPs This book deals with the advances in control of DBPs in drinking water systems Further than an providing an overview of existing disinfection techniques and by products up to date information on the parameters affecting the procedures of DBPs formation analytical methods for their determination toxicity regulation it pays special emphasis on the advanced treatment methods applied recently for DBPs control and presents recent promising findings as well as case studies in this field as the relevant research is proceeding producing more knowledge and practical solutions in regard to the disinfected drinking water quality

Maintaining Distribution System Residuals Through Booster Chlorination

James G. Uber,2004 The goal of this project was to discuss the potential advantages associated with booster disinfection the kinetics of chlorine decay and trihalomethane THM formation under rechlorination conditions and the use of network hydraulic and water quality models to locate booster disinfection stations and determine their dose characteristics The following are highlights from the research A laboratory procedure was proposed for analyzing chlorine decay under simulated booster conditions An initial set of experiments evaluated disinfectant decay under booster conditions and found it to be dependent on both the magnitude and time of the boost dose THM formation under booster conditions showed no long term reduction for any set of results indicating THM formation is not solely dependent on disinfectant concentration In booster chloramination boosting with chlorine appeared to be very successful at producing and maintaining a low ammonia concentration by recombining with the ammonia formed from chloramine decay A second order model including a reaction component that represents natural organic matter was developed to describe chlorine decay and THM formation under booster conditions A method was developed to determine good locations and schedules for multiple booster doses by a systematic evaluation of alternative designs using network models By exploring the disinfection decay kinetics under rechlorination and developing methods for booster chlorination systems design the project results will assist utilities and consultants in making better use of booster disinfection as a residual maintenance approach Originally published by AwwaRF for its subscribers in 2003

Assessment of Chloramine and Chlorine Residual Decay in the Distribution System Zaid K. Chowdhury,R. Scott Summers,Lori Work,Natalie Smith,Lewis Rossman,James G. Uber,2007-03-01 Maintaining chlorine and chloramine residual is a key factor that determines potability of distributed water Decay of these disinfectants is affected by various water quality and infrastructure related factors Understanding the decay of residuals in the distribution system is critical with respect to safe delivery of drinking water and in developing water quality models that can be used by utilities for the operation of potable water delivery systems In order to comply with microbial and disinfection byproduct M DBP regulations water suppliers are continually investing in treatment processes for achieving greater levels of inactivation and DBP precursor removal As a result of these changes in water quality maintaining a disinfectant residual in the distribution system can be challenging Bench scale testing has been used to determine the effect of advanced treatment enhanced coagulation granular activated carbon adsorption ozonation biofiltration and ultraviolet irradiation on chlorine and chloramine decay Additional studies

examine the effects of disinfectant dose temperature pH blending and rechlorination The effects of water quality on pipe wall demand were evaluated using the distribution system simulator at the U S Environmental Protection Agency s Test and Evaluation Center Several models are developed regarding disinfectant decay making it easier to predict chlorine demand after changes in treatment The multi species water quality analysis and network path analysis extensions to EPANET will make the modeling package more robust and will allow utilities to predict chlorine residual at any point in their distribution system with greater confidence

Biofilm Systems IV F. Rogalla, Marinus Cornelis Maria Loosdrecht, 2000-05-31 In the last decade biofilm systems have made staggering progress With adaptation of the process to nitrogen removal trickling filters have become an economical alternative to activated sludge enabling the upgrading of thousands of plants Better understanding of rotating biological contractors has made them a preferred technology for small scale plants and there is growing use of biological aerated filters especially in small footprint nitrogen removal High rate fluidised bed or airlift reactors both anaerobic and aerobic with and without carriers have shown their efficiency in several hundred industrial applications leading to applications in municipal treatment Moving bed biofilm reactors now compete with hybrid systems for upgrading existing activated sludge basins The biofilm conference also brings together professionals studying clean water aspects of biofilms with those applying them to wastewater reactors While the latter use the growth of fixed bacteria to optimise the efficiency of treatment systems the former aim to combat formation of biofilms in distribution networks But many tools for analysis and modelling can be shared and the knowledge of what favours biofilm growth and performance can be used to inhibit their occurrence These proceedings offer an unrivalled authoritative collection of current work worldwide on the research development and application of biofilm systems
