Early Development Xenopus Laevis:

Early Development of Xenopus Laevis Hazel L. Sive, Robert M. Grainger, Richard M. Harland, 2000 Amphibian embryos are supremely valuable in studies of early vertebrate development because they are large handle easily and can be obtained at many interesting stages And of all the amphibians available for study the most valuable is *Xenopus laevis* which is easy to keep and ovulates at any time of year in response to simple hormone injections *Xenopus* embryos have been studied for years but this is a particularly exciting time for the field Techniques have become available very recently that permit a previously impossible degree of manipulation of gene expression in intact embryos as well as the ability to visualize the results of such manipulation As a result a sophisticated new understanding of *Xenopus* development has emerged which ensures the species continued prominent position among the organisms favored for biological investigation This manual contains a comprehensive collection of protocols for the study of early development in *Xenopus* embryos It is written by several of the field's most prominent investigators in the light of the experience they gained as instructors in an intensive laboratory course taught at Cold Spring Harbor Laboratory since 1991 As a result it contains pointers hints and other technical knowledge not readily available elsewhere This volume is essential reading for all investigators interested in the developmental and cell biology of *Xenopus* and vertebrates generally Many of the techniques described here are illustrated in an accompanying set of videotapes which are cross referenced to the appropriate section of the manual

Cellular Basis of Morphogenesis David Evered, Joan Marsh, 1989-08-15 Contributors to this symposium focus on the interface between genes and cells covering genetic analysis cloning studies and the investigation of cell lineages and cellular interactions They note how the body axes are already determined in the eggs of invertebrates and amphibia then consider the mechanisms as the egg cleaves in annelids arthropods amphibia and mice that underlie assignation of cells to specific lineages which give rise to different tissues in the adult Closing chapters characterize the molecules that mediate each cell's particular fate its position in the final body plan as the result of cell sorting or in some cases cell migration
