Cholesterol In Membrane Models:

Cholesterol in Membrane Models Leonard X. Finegold, 1992-12-15 *Cholesterol in Membrane Models* provides the most recent summary available of basic molecular models and experiments in models of biological membranes The book introduces the cell biology of cholesterol and covers the modeling of cholesterol in model membranes by the mean field and Monte Carlo theoretical methods The experimental movement of cholesterol into model membranes and phase diagrams of cholesterol in these membranes by nuclear magnetic resonance and by thermal techniques using different lipid chain lengths are discussed Light and electron microscopy that explore the spatial distribution of cholesterol in the model membrane are covered The book also examines the use of infrared Raman and neutron spectroscopy *Cholesterol in Membrane Models* is an excellent learning resource research tool and reference for a wide range of experimental and theoretical scientists including cellular biologists biophysicists biochemists and molecular modelers

Molecular Simulations of the Effect of Cholesterol on Membrane-Mediated Protein-Protein Interactions

Frédéric Jean-Marie De Meyer,2010 In this work we use molecular simulations to investigate how cholesterol affects membrane mediated protein protein interactions We consider a typical hydrated biological model membrane containing saturated phospholipids for example dimyris toylphosphatidylcholine or DMPC cholesterol and trans membrane proteins We introduce a model in which the different molecules are coarse grained retaining their hydrophobic and hydrophilic properties together with their main structure and flexi bility The system is studied using a hybrid Monte Carlo dissipative particle dynamics method First we study lipid mediated protein protein interactions in a pure hydrated sat urated phospholipid bilayer The potential of mean force between the proteins show that hydrophobic forces drive long range lipid mediated protein protein interactions and that the nature of these interactions depends on the length of the protein hy drophobic segment on the three dimensional structure of the protein and on the properties of the lipid bilayer The concept of hydrophilic shielding is introduced to gain insight into the nature of the computed potentials of mean force To study the effect of cholesterol on the properties of a membrane we extend our model to cholesterol Structural and mechanical properties of the hydrated bi layer containing a saturated lipid and cholesterol are studied at various temperatures and cholesterol concentrations The properties studied are the area per lipid con densation bilayer thickness tail order parameters bending modulus and area com pressibility The model quantitatively reproduces most of the experimental effects of cholesterol on these properties and reproduces the main features of the experi mental temperature composition phase diagram Based on the changes in structural properties a temperature composition structure diagram is proposed which is com pared with the experimental phase and structure diagrams The lateral organization of cholesterol in the bilayer is also discussed In a second part modifications of the cholesterol model are made to allow a better understanding of the cholesterol

condensation effect This condensation effect is further discussed in relation to the DMPC cholesterol phase behavior Finally the effect of cholesterol on lipid mediated protein protein interactions is investigated This is done in accordance with the results concerning the effect of cholesterol on the phase behavior of lipid bilayers The calculations of the potential of mean force between proteins and protein clusters show that the addition of cholesterol gradually reduces repulsive lipid mediated interactions between certain proteins At a given cholesterol concentration the interactions even become attractive Hence cholesterol significantly promotes protein aggregation The role of protein induced dynamical cholesterol enriched and cholesterol depleted shells in these effects is discussed in detail

Advances in Membrane Fluidity, Drug and Anesthetic Effects on Membrane Structure and Function Roland C. Aloia, Cyril C. Curtain, Larry M. Gordon, 1991-02-19 This volume presents a thorough analysis of the current theories of action of anaesthetics and other amphiphathic molecules It concentrates on aspects of how such molecules interact with the membranes of the central nervous system thereby producing the anaesthetic state The authors discuss the multiple anaesthetic binding sites within the membrane and their relationship to the chemical composition of the membrane and the unique structure of the drug molecule
