[High-Performance VLSI Signal Processing Innovative Architectures and Algorithms, Algorithms and Architectures](#) K. J. Ray Liu, Kung Yao, 1998 Electrical Engineering Signal Processing High Performance VLSI Signal Processing Innovative Architectures and Algorithms Volume 1 Algorithms

and Architectures The first volume in a two volume set High Performance VLSI Signal Processing Innovative Architectures and Algorithms brings together the most innovative papers in the field focused introductory material and extensive references The editors present timely coverage of algorithm and design methodologies with an emphasis on today s rapidly evolving high speed architectures for VLSI implementations These volumes will serve as vital resources for engineers who want a comprehensive knowledge of the extremely interdisciplinary field of high performance VLSI processing The editors provide a practical understanding of the merits of total system design through an insightful synergistic presentation of methodology architecture and infrastructure Each volume features Major papers that span the wide range of research areas in the field Chapter introductions including historical perspectives Numerous applications oriented design examples Coverage of current and future technological trends Thorough treatment of high speed architectures *Retiming, Folding and Register Minimization for DSP Synthesis* Tracy Carroll Denk,1996 This thesis introduces some formal techniques which can be used for synthesis of VLSI very large scale integration architectures for DSP digital signal processing algorithms These techniques can be used to design architectures for single rate and single dimensional DSP multirate and single dimensional DSP and single rate and multi dimensional DSP For single rate and single dimensional DSP we have developed a novel technique for exhaustively generating all retiming and scheduling solutions for the DSP algorithm The significance of this contribution is twofold First it allows a circuit designer to explore a large space of possible high level implementations for the algorithm which allows the designer to make a good decision about the high level architectural details of the design Second this work explicitly shows the important interaction between retiming and scheduling in high level synthesis While retiming and scheduling have been treated as separate problems in the past our work uses a mathematical framework to show that retiming is a special case of scheduling Also for single rate and single dimensional DSP we have developed techniques for computing the minimum number of registers required to implement a statically scheduled DSP program Closed form expressions are derived for computing the minimum number of registers assuming various memory models with or without retiming the scheduled DFG This is an important problem because memory typically occupies a large portion of the area of a DSP implementation often over half of the area and minimizing this area leads to more efficient designs For multirate and single dimensional DSP we have developed a multirate folding technique which can be used to synthesize single rate architectures from multirate DSP algorithms Prior to the development of this formal technique the design of single rate **EDN.** ,1987 **Journal of the Audio Engineering Society** Audio Engineering Society,1997 Directory of members published as pt 2 of Apr 1954 issue **Signal Processing IV** Jean-Louis Lacoume,1988 This was the fourth in a sequence of international conferences promoted and organized by the European Association for Signal Processing EURASIP This book in three volumes presents the proceedings of that conference EUSIPCO 88 comprised 47 separate sessions organized in 7 parallel programs Each of the 438 papers that were presented at the conference were reviewed by at least two

referees from two independent institutions In addition 8 tutorials were contributed by experts in a large field of topics from Hidden Markov Fields to High Definition TV Systems The new technical potential of the DSP opening new frontiers was evidenced by the plenary session on Cheap and Powerful DSP Technologies A Challenge The contributions are grouped by topic in the contents in order to facilitate easy access The diversity of the topics as well as the extraordinary tempo at which Signal Processing has progressed since the first conference in Lausanne 1980 attest to the permanent vitality of this field of research and development Due to the extensive length of the contents only the number of papers presented per session is listed below

Signal Processing, Theories and Applications, 1990 *Principles of Digital Audio* Ken C. Pohlmann, 1989 A comprehensive technical reference this handbook covers all the latest technologies of digital audio Introduces the fundamentals of binary numbers sampling quantizing and dither includes discussions of CD I DAT DSP and recordable provides numerous tables and diagrams to simplify information Doubles as a user s handbook or textbook
