**Boundary-layer Structure in Flow Over a Heterogeneous Surface** Patrick Samuelsson,1999 Proceedings of Fluid Mechanics and Fluid Power (FMFP) 2023, Vol. 1 Hardik Kothadia,K. R. Arun,G. Rajesh,Jaywant H. Arakeri,2025-03-15 This book presents select proceedings of the 10th International and 50th National Conference on Fluid Mechanics and Fluid Power It covers recent research developments in the area of fluid mechanics measurement techniques in fluid flows and computational fluid dynamics The key research topics discussed in this book are fundamental studies in flow instability and transition fluid structure interaction multiphase flows solidification melting cavitation porous media flows bubble and droplet dynamics bio MEMS micro scale experimental techniques flow control devices underwater vehicles bluff body bio fluid mechanics aerodynamics turbomachinery propulsion and power heat transfer and thermal engineering fluids engineering advances in aerospace and defence technology micro and nano systems engineering acoustics structures and fluids advanced theory and simulations novel experimental techniques in thermofluids engineering and many more The book is a valuable reference for researchers and professionals interested in thermo fluids engineering *Applied Mechanics Reviews* ,1991

**The Atmosphere over Mountainous Regions** Miguel A. C. Teixeira,Daniel J. Kirshbaum,Haraldur Ólafsson,,Peter F. Sheridan,Ivana Stiperski,2016-11-09 Mountainous regions occupy a significant fraction of the Earth s continents and are characterized by specific meteorological phenomena operating on a wide range of scales Being a home to large human populations the impact of mountains on weather and hydrology has significant practical consequences Mountains modulate the climate and create micro climates induce different types of thermally and dynamically driven circulations generate atmospheric waves of various scales known as mountain waves and affect the boundary layer characteristics and the dispersion of pollutants At the local scale strong downslope winds linked with mountain waves such as the Foehn and Bora can cause severe damage Mountain wave breaking in the high atmosphere is a source of Clear Air Turbulence and lee wave rotors are a major near surface aviation hazard Mountains also act to block strongly stratified air layers leading to the

formation of valley cold air pools with implications for road safety pollution crop damage etc and gap flows Presently neither the fine scale structure of orographic precipitation nor the initiation of deep convection by mountainous terrain can be resolved adequately by regional to global scale models requiring appropriate downscaling or parameterization Additionally the shortest mountain waves need to be parameterized in global weather and climate prediction models because they exert a drag on the atmosphere This drag not only decelerates the global atmospheric circulation but also affects temperatures in the polar stratosphere which control ozone depletion It is likely that both mountain wave drag and orographic precipitation lead to non trivial feedbacks in climate change scenarios Measurement campaigns such as MAP T REX Materhorn COLPEX and i Box provided a wealth of mountain meteorology field data which is only starting to be explored Recent advances in computing power allow numerical simulations of unprecedented resolution e g LES modelling of rotors mountain wave turbulence and boundary layers in mountainous regions This will lead to important advances in understanding these phenomena as well as mixing and pollutant dispersion over complex terrain or the onset and breakdown of cold air pools On the other hand recent analyses of global circulation biases point towards missing drag especially in the southern hemisphere which may be due to processes currently neglected in parameterizations A better understanding of flow over orography is also crucial for a better management of wind power and a more effective use of data assimilation over complex terrain This Research Topic includes contributions that aim to shed light on a number of these issues using theory numerical modelling field measurements and laboratory experiments

Sivapalan,1995-09-11 There is a growing need for appropriate models which address the management of land and water resources and ecosystems at large space and time scales Theories of non linear hydrological processes must be extrapolated to large scale three dimensional natural systems such as drainage basins flood plains and wetlands This book reports on recent progress in research on scale issues in hydrological modelling It brings together 27 papers from two special issues of the journal *Hydrological Processes* The book makes a significant contribution towards developing research strategies for linking model parameterisations across a range of temporal and spatial scales The papers selected for this book reflect the tremendous advances which have been made in research into scale issues in hydrological modelling during the last ten years
