Extreme Low-Power Mixed Signal IC Design Armin Tajalli, Yusuf Leblebici, 2010-09-14 Design exibility and power consumption in addition to the cost have always been the most important issues in design of integrated circuits ICs and are the main concerns of this research as well Energy Consumptions Power dissipation P and energy consumption are diss pecially important when there is a limited amount of power budget or limited source of energy Very common examples are portable systems where the battery life time depends on system power consumption Many different techniques have been veloped to reduce or manage the circuit power consumption in this type of systems Ultra low power ULP applications are another examples where power dissipation is the primary design issue In such applications the power budget is so restricted that very special circuit and system level design techniques are needed to satisfy the requirements Circuits employed in applications such as wireless sensor networks WSN wearable battery powered systems 1 and implantable circuits for biol ical applications need to consume very low amount of power such that the entire system can survive for a very long time without the need for changing or recharging battery 2 4 Using new power supply techniques such as energy harvesting 5 and printable batteries 6 is another reason for reducing power dissipation Devel ing special design techniques for implementing low power circuits 7 9 as well as dynamic power management DPM schemes 10 are the two main approaches to control the system power consumption Design Flexibility Design exibility is the other important issue in modern in grated systems
