GENERAL STUDIES AND REVIEWS

Very little was published in 1972 furthering the fundamental understanding of charge transfer between solids Krupp (19) presented a model based on solid state band structure modified by surface states He also discussed the problem of backflow during separation of the contacting surfaces Surface states can be used to explain why charges remain localized on the surface of an insulator and backflow can be used to explain why anomalous results exist But the fact remains that little independent evidence exists for the assumed density and energy level position of surface states on insulators used to explain contact charging This type of model is useful in predicting maximum charge transfers but few electrification experiments are designed to determine maximum charge transfer Thus how valid models such as this are to the understanding of static electrification of solids remains to be seen Other authors proposing models were Bassler (3) and von Harrach and Chapman (32 33)

Most of the other studies on separation electrification were phenomenological in character Williams (35) discussed charge development and static dissipation for textiles and developed the equation $y = a^{-bx}$ relating surface resistivity y to moisture regain or relative humidity x where a and b are constants derived from his measurements Murasaki et al (22) studied the decay of charges of both polarities produced by contact or rubbing on copolymers of methyl methacrylate and styrene They concluded that surface recombination was a more effective mechanism for discharge than leakage from the surface and that the recombination rate depends on the molecular fraction of copolymer

Shinohara et al (29) studied the relation between charging and the number of bonding units in copolymers of polystyrene and methyl methacrylate of vinyl acetate and maleic anhydride and of acrylamide and maleic anhydride They calculated the saturated charge on these copolymers using the number of bonds between the copolymers and their calculations agreed with experiment Wåhlin and Bäckström (34) studied the electrification of polytetrafluoroethylene (Teflon) when rubbed by a copper electrode with different radii of curvature They concluded that the measured charge was proportional to the area swept out by the copper electrode with a constant of proportionality equal to $2.0 \times 10^{-8} \text{ C cm}^2$ for this system

Two papers Hays (11) and Inculet (14) studied the effect of electric fields on charging Both found an effect Hays who worked in air
