

Visualization over the World Wide Web

Extended Abstract of Keynote Lecture

The dramatic growth of the World Wide Web in the past few years opens new opportunities for the visualization community. There are an increasing number of publicly available datasets on the Web - such as government statistics, weather data, environmental data - all typically provided by the publisher in numerical form, yet better understood in diagrammatic form. We need to determine the best means of providing a Web visualization service.

*In this talk, we begin by discussing the different system architectures for visualization over the Web. We can assume that there are three players involved in the game: the **user**, the **data provider**, and the **visualization service provider**. In the most general case, each will be at a different Internet location.*

To start with, we shall make the following basic assumptions. The user will have access to a Web browser - with the capability to view VRML (the draft ISO standard for 3D graphics over the Web) and to execute Java applets. The visualization service provider will host a Web server.

*Different system architectures then arise as we place the **visualization software**, the **compute facility** and the **data**, with the different players in the game. For example, if we place the visualization software and compute facility with the visualization service provider, we get a **server-side** solution; if we place them with the user, we get a **client-side** solution.*

*We shall then look at some specific instances of Web visualization services. The Vis-5D meteorological visualization service, developed by Hibbard at University of Wisconsin, is a **client-side** solution. The visualization service provider merely hosts a Web page, and assumes that the user has an implementation of Vis-5D on their workstation. The user points their browser at the Web page, enters the location of the weather data set, and the data is transferred across the Internet as a special MIME-type. This is recognized by the browser which fires up Vis-5D in order to view the data.*

*The air quality visualization service, developed by Wood, Brodlie and Wright at University of Leeds, is a **server-side** solution. The visualization service provider hosts not only a web page, but also a special visualization process based on IRIS Explorer. The user points their browser at the Web page, enters the location of the air quality data, and the data is fetched to the server where it is processed by IRIS Explorer. The visualization is returned to the user as VRML.*

There are hybrid solutions also, where the visualization software is held by the visualization service, but executed by the user on their own workstation. The key technology here is of course Java. A number of Java visualization services are emerging and will be described.

The location of the data may also vary. In the public service cases mentioned above (weather data and air quality data), the data resides with a specialist data provider. In other instances however, the data may well reside with the user themselves - indeed this is the traditional scientific visualization case.

Finally we shall look at how Web visualization services may develop into collaborative environments where groups of interested people may co-operate in the exploration of a dataset.

The examples mentioned in the talk are illustrated on my Web page: <http://www.scs.leeds.ac.uk/kweb/>
