## **Between Rationalism And Empiricism:**

**Between Rationalism and Empiricism** Erhard Scheibe, 2012-12-06 Erhard Scheibe is one of the most outstanding German philosophers of science. He has written extensively on all the problems that confront the philosophy of mathematics and physics: rationalism versus empiricism, the laws of nature, and reductionism. He has published books on the logical foundations of quantum mechanics and on the reduction of physical theories. Little of his work has been translated into English. This collection of 38 essays is intended to remedy this omission and to help to make Erhard Scheibe's philosophical ideas better known to an international audience. *The Building Blocks of Thought* Stephen Laurence, Eric Margolis, 2024-12-17 This is an open access title available under the terms of a CC BY-NC-ND 4.0 International licence. It is free to read on Oxford Academic and offered as a free PDF download from OUP and selected open access locations. This is a broad and authoritative study of one of the central topics in the study of the mind: the origins of concepts. The authors survey the debate between rationalists and empiricists, which stretches back to the very beginnings of philosophy and has been at the centre of some of the most exciting research in cognitive science. Many have charged that the debate is riddled with confusion or that rationalist approaches, in particular, are deeply problematic. *The Building Blocks of Thought* offers a comprehensive rethinking of the foundations of this debate, showing that these negative appraisals are based on misunderstandings. Stephen Laurence and Eric Margolis argue that the debate should be understood to concern the nature of the unlearned psychological traits that provide the foundation for learning all concepts. They go on to argue for a version of concept nativism according to which there is a rationalist account of the origins of many concepts across many different conceptual domains. This rationalist view is developed around seven distinct arguments, drawing on a wealth of data across the cognitive sciences, which are shown to come together to form a unified large-scale argument to the best explanation for a rationalist account of the origins of concepts. Rounding out the case for concept nativism, the book contrasts this view with the most important and influential empiricist views, as well as alternative rationalist views, including Fodor's infamous radical concept nativism and his claim that concept learning is impossible. *The Building Blocks of Thought* argues for the enormous importance of learning and culture, showing how a thoroughly rationalist approach facilitates and enhances cultural learning and provides the foundations for the best overall account of the origins of concepts. **The Natural and the Normative** Gary Carl Hatfield, 1990 Gary Hatfield examines theories of spatial perception from the seventeenth to the nineteenth century and provides a detailed analysis of the works of Kant and Helmholtz, who adopted opposing stances on whether central questions about spatial perception were amenable to natural scientific treatment. At stake were the proper understanding of the relationships among sensation, perception, and experience, and the proper methodological framework for investigating the mental activities of judgment, understanding, and reason—issues which remain at the core of philosophical psychology and cognitive science. Hatfield presents these important issues as living philosophies of science that shape and are shaped by

actual research programs creating a complex and fascinating picture of the entire nineteenth century battle between nativism and empiricism His examination of Helmholtz's work in physiological optics and epistemology is a tour de force Gary Hatfield is Associate Professor of Philosophy at the University of Pennsylvania **The Ways of Knowing** William Pepperell Montague, 1925 *I-Language* Daniela Isac, Charles Reiss, 2025-06-05 *I Language* introduces the uninitiated to linguistics as cognitive science In an engaging down to earth style Daniela Isac and Charles Reiss give a crystal clear demonstration of the application of the scientific method in linguistic theory Their presentation of the research program inspired by Noam Chomsky shows how the focus of theory and research in linguistics shifted from treating language as a disembodied human external entity to cognitive biolinguistics the study of language as a human cognitive system embedded within the mind brain of each individual The recurring theme of equivalence classes in linguistic computation ties together the presentation of material from phonology morphology syntax and semantics The same theme is used to help students understand the place of linguistics in the broader context of the cognitive sciences by drawing on examples from vision audition and even animal cognition This textbook is unique in its integration of empirical issues of linguistic analysis engagement with philosophical questions that arise in the study of language and treatment of the history of the field Topics ranging from allophony to reduplication ergativity and negative polarity are invoked to show the implications of findings in cognitive biolinguistics for philosophical issues like reference the mind body problem and nature nurture debates The well tested material in the book is appropriate for a variety of audiences from large introductory courses in linguistics to graduate seminars in cognitive science or philosophy of mind It contains numerous exercises and guides for further reading as well as ideas for student projects A companion website with guidance for instructors and answers to the exercises features a series of pdf slide presentations to accompany the teaching of each topic This fully revised and updated second edition includes additional exercises and expanded discussions on topics such as language and culture philosophy and rationalist explorations of language and mind
