Baboon Fundamentals Studies:

Fundamental Aspects of Neoplasia A.A. Gottlieb, O.J. Plescia, D.H.L. Bishop, 2012-12-06 The control of cancer is at once a major public health problem and a problem of fundamental biologic interest. As a result of technologic developments and new insights in the realm of molecular biology, new and important approaches to an understanding of neoplasia are now possible. Several aspects of neoplasia are clearly of microbiologic interest, including the role of viruses in the etiology of cancer, control of the immune response to tumor cells, and the susceptibility of tumor-bearing hosts to overwhelming infection as a result of immunodeficiency. Recent advances in these areas led us to organize this symposium, and through this publication to record some of the progress being made in laboratories around the world in understanding some of the basic aspects of the cancer problem. This symposium was held as part of the commemoration of the twentieth anniversary of the Waksman Institute of Microbiology. Dr. Waksman's devotion to the study of the smallest forms of life and the commitment of the Waksman Institute to the free pursuit of knowledge are the underpinnings of the institute's research efforts in the broad area of microbiology, including the problem of neoplasia. It is of interest to note that actinomycin, one of the earliest antibiotics discovered in Waksman's laboratory, was also one of the first compounds found to be clinically useful in the treatment of certain types of cancer.

The Fundamental Mechanisms of Shock L. Hinshaw, 2013-04-17 Research to which so much discussion and thought will be devoted at this symposium appears to have been downgraded in our society. Yet learning and education per se rank high in our set of values from the point of view of both lay people and professional workers. For some reason we fail to detect the illogic inherent in this value system for what is research but the learning of new information. Apparently our society associates learning only with known, long-gathered information. This symposium, I believe, will generate new information about shock through the integration of knowledge of many investigators who have come to share a common meeting ground. Hopefully the worth of this and similar endeavors will gain the recognition and more important the support of the public. In the next decade or so, I believe that shock research workers will be channeling their efforts more and more into investigating the repair of damaged cells. The individual cell and its products must be scrutinized just as carefully as we examine the whole organism or its collections of cells. Shock is an exciting area of research, but it involves years of painstaking work. Moreover, the society which will reap its fruits must be persuaded to share the burden of its support.

[The Baboon in Biomedical Research](#) John L. VandeBerg, Sarah Williams-Blangero, Suzette D. Tardif, 2009-06-04 Nonhuman primates have played critical roles in biomedical research and they are among the few animals whose use in research continues to increase. The scientific value of nonhuman primates derives from their close phylogenetic proximity to man and their consequent anatomic, physiologic, and genetic similarities to man. Only nonhuman primates can provide adequate models for many complex physiological and disease processes of humans. The baboon is a relative

newcomer to the repertoire of nonhuman primates used in biomedical research. However, in less than 50 years since its first use in the U.S., it has become one of the most popular laboratory primate species. It is larger than the other widely used monkey species, making it advantageous for many types of experiments and technological developments. It is extraordinarily hardy and highly fecund in captivity. It closely resembles humans in a variety of physiological and disease processes such as cholesterol metabolism, early stages of atherosclerosis, and alcoholic liver disease. Its chromosomes closely resemble those of humans, and many genes of the two species lie in the same chromosomal order. Among all primates, baboons are the most widely used models for the genetics of susceptibility to complex diseases, and they are the first nonhuman primate for which a framework genetic linkage map was established. In addition, the baboon genome is currently being sequenced, and as a result, the utility of this species for biomedical research will be dramatically increased.

Sex and Friendship in Baboons Barbara B. Smuts, 2007-03 Those who have been privileged to watch baboons long enough to know them as individuals and who have learned to interpret some of their more subtle interactions will attest that the rapid flow of baboon behavior can at times be overwhelming In fact some of the most sophisticated and influential observation methods for sampling vertebrate social behavior grew out of baboon studies invented by scientists who were trying to cope with the intricacies of baboon behavior Barbara Smuts eloquent study of baboons reveals a new depth to their behavior and extends the theories needed to account for it While adhering to the most scrupulous methodological strictures the author maintains an open research strategy respecting her subjects by approaching them with the open mind of an ethnographer and immersing herself in the complexities of baboon social life before formulating her research design allowing her to detect and document a new level of subtlety in their behavior At the Gilgil site described in this book she could stroll and sit within a few feet of her subjects By maintaining such proximity she was able to watch and listen to intimate exchanges within the troop she was able in other words to shift the baboons well along the continuum from subject to informant By doing so she has illuminated new networks of special relationships in baboons This empirical contribution accompanies theoretical insights that not only help to explain many of the inconsistencies of previous studies but also provide the foundation for a whole new dimension in the study of primate behavior analysis of the dynamics of long term intimate relationships and their evolutionary significance At every stage of research human observers have underestimated the baboon These intelligent curious emotional and long lived creatures are capable of employing stratagems and forming relationships that are not easily detected by traditional research methods In the process of unraveling their complex social relationships Smuts has revealed that these masters of strategy and aggressive competition are equally capable of patience tenderness and concern Barbara B Smuts is professor of psychology and anthropology University of Michigan Ann Arbor She is also the author of *Primate Societies*
