Data Analysis for Hyphenated Techniques E.J. Karjalainen, U.P. Karjalainen, 1996-03-14 Based on a concrete set of working MATLAB programs the book begins with a short program of snippets describing basic principles and proceeds to a complete application program filling a central analytical need obtaining pure spectra from the observed overlapping spectra with standard deviations for the resolutions obtained The strength of the book is the open nature of the programs All programs can be read tested and modified by the user The mathematical principles needed for the proper treatment of experimental data are thoroughly described The first part of the book describes how data is collected converted and prepared for the actual deconvolution Practical working algorithms such as the Savitzky Golay smoothing method are emphasized The reader can see how searches in spectral libraries can be greatly speeded up by proper formulation of the calculation Basic signal processing is described by illustrative examples The main part of the book describes the deconvolution of overlapping chromatographic peaks Principle component analysis is described and used as a useful tool The main emphasis is a discussion of a deconvolution method OSCAR Optimization by Stepwise Constraining of Alternating Regression developed by the authors The results can be validated as OSCAR calculates confidence intervals for the spectra and elution curves For users who do not want to enter the programs by hand a separate CD ROM is available It contains the programs and extensive sample data files The CD ROM has instructional multimedia showing step by step how the programs are used for the problems in the book The MATLAB programs and datafiles can be directly run on Windows and Macintosh computers having a MATLAB interpreter

Advanced Technologies for the Quality Control and Standardization of Plant Based Medicines Jiang Xu, Caroline Howard, 2020-06-18 Herbs and herbal products are of paramount importance for human health To be able to guarantee safety and quality standards and testing methods are needed Pharmacopoeias contain quality control protocols setting the standards which are then required by governments The quality traits are many including the intrinsic variables of medicinal plant e.g. the levels of the active compounds and the absence of possibly naturally occurring toxic compounds On the other hand many quality traits are related to agricultural conditions and practices or to the harvesting and post harvest processing With so many variables quality control of the end product becomes extremely complex time consuming and costly To ensure the quality of medicinal plants for human consumption quality management the use of good practices at each step from seed to final product becomes a crucial aspect In general quality control includes the inspection of the product's identity purity and content based on its physical chemical or biological properties To ensure the quality of herbal medications criteria such as botanical quality type of preparation physical constants adulteration contaminants chemical constituents pesticides residues et al should be examined Meanwhile authentication of herbs is needed to avoid possible adulteration or contaminating plants even toxic herbs such as *Aristolochia* species Many of the methods are long standing such as microscopy in combination with color reactions but some 50 years ago chromatography

developed as a major tool for both qualitative and quantitative analysis of herbal preparations. Nowadays research is working on the improvement of these methods and on the development of novel tools. For instance, next generation sequencing and mass spectrometry imaging are emerging as new technologies for the quality control of herbal medicines. With these technologies, quick testing of herbal products and of mixed herbal powder preparations, including the testing for specific plant parts, botanical drugs, can be achieved. Also, novel chemical tools such as metabolomics and Near Infrared Red (NIR) spectroscopy are being developed as powerful tools to identify and to link these with activity by using chemometric tools such as multivariate analysis. Finally, progress of informatic tools such as machine learning helps to deal with the big data generated by sequencing or mass spectrometry. However, these new technologies like all other new born technologies should be tested and perfected for a broad range of products.
