Neely, 2016 Nettavisen is a Norwegian online start-up that experienced a boost after the financial crisis of 2009. Since then, the firm has been able to increase its market share and profitability through the use of highly disruptive business models, allowing the relatively small staff to outcompete powerhouse legacy publishing companies and new media players such as Facebook and Google. These disruptive business models have been successful as Nettavisen captured a large market share in Norway early on and was consistently one of the top three online news sites in Norway. Capitalising on media data explosion and the recent acquisition of blogger network Blog.no, Nettavisen is moving towards a data-driven business model DDBM. This case study discusses this topic. *Data-Driven Innovation* Michael Moesgaard Andersen, Torben Pedersen, 2021-03-02 Today, innovation does not just occur in large and incumbent R & D organizations. Instead, it often emerges from the start-up community. In the new innovation economy, the key is to quickly find pieces of innovation, some of which may already be developed. Therefore, there is the need for more advanced means of searching and identifying innovation wherever it may occur. We point to the importance of data-driven innovation based on digital platforms as their footprints are growing rapidly and in sync with the shift from analogue to digital innovation workflows. This book offers companies insights on paths to business success and tools that will help them find the right route through the various options when it comes to the digital platforms where innovations may be discovered and from which value may be appropriated. The world hungers for growth, and one of the most important vehicles for growth is innovation. In light of the new digital platforms from which data-driven innovation can be extracted, major parts of analogue workflows will be substituted with digital workflows. Data-driven innovation and digital innovation workflows are here to stay. Are you **Machine Learning. A Guideline for its Usability in Production Systems** Alexander Volz, 2019-06-28 Bachelor Thesis from the year 2017 in the subject Engineering Mechanical Engineering grade 1.3 RWTH Aachen University language English abstract This thesis provides an especially designed overview for the needs of decision makers in the production industry on the field of machine learning. By concerning economic and technological factors as well as the individual challenges for companies, the goal of this thesis is to serve as a guideline for the usage of machine learning in production systems. After the revolutionary change caused by the introduction of the steam engine, the production line electronics and IT into the manufacturing industry, a new disrupting change is expected. Nowadays, the rapidly increasing digitalization of the economy leads to the fourth industrial revolution. This global phenomenon is called Industrie 4.0, GER or Smart Factory US, and it combines production technology with information and communication technology. Especially data

based optimization in production is one of the predominant goals of Industrie 4.0. For the automatized analysis of large amounts of data, machine learning is an effective instrument and therefore a central element in Industrie 4.0. Recent progress in machine learning has been driven by the development of new learning algorithms and by the increasing availability of data and low cost computation power. For many applications, from computer vision to adaptive robots, it was very difficult to devise deterministic rules. However, for these applications, it is possible to collect data and now the idea is to use algorithms that learn from data instead of being manually programmed. Thus, machine learning has the potential to transform data into valuable knowledge for decision making while making improvements possible to the production system with approaches such as predictive maintenance. The transfer of machine learning from the lab to the real world leads to an increased interest in learning techniques, demanding further effort in explaining how machine learning works and what it can be used for in other disciplines. However, the entry barrier to the diverse field of machine learning is high. With many different algorithms, theories, and methods, it is hard to oversee, and therefore its influence remains limited. In addition, a recent study states that about 47% of jobs in the US are at high risk of computerization within the next decades. Therefore, employees feel insecure and demand answers on what effect machine learning will have on their future role in the factory.
