*Real-Time Database and Information Systems: Research Advances* Azer Bestavros,Victor Fay-Wolfe,2012-12-06 Real time systems are defined as those for which correctness depends not only on the logical properties of the produced results but also on the temporal properties of these results In a database real time means that in addition to typical logical consistency constraints such as a constraint on a data item s value there are constraints on when transactions execute and on the freshness of the data transactions access The challenges and tradeoffs faced by the designers of real time database systems are quite different from those faced by the designers of general purpose database systems To achieve the fundamental requirements of timeliness and predictability not only do conventional methods for

scheduling and transaction management have to be redesigned but also new concepts that have not been considered in conventional database systems or in real time systems need to be added Real Time Database and Information Systems Research Advances is devoted to new techniques for scheduling of transactions concurrency management transaction logging database languages and new distributed database architectures Real Time Database and Information Systems Research Advances is primarily intended for practicing engineers and researchers working in the growing area of real time database and information retrieval systems For practitioners the book will provide a much needed bridge for technology transfer and continued education For researchers the book will provide a comprehensive reference for well established results The book can also be used in a senior or graduate level course on real time systems real time database systems and database systems or closely related courses

magnitude faster than prior real time database systems Another contribution of MDARTS is that it supports explicit declarations of real time requirements and semantic constraints within application code The MDARTS library examines these declarations at database object initialization time and attempts to construct objects that are compatible with the requirements MDARTS supports both local shared memory transactions and remote transactions that use remote procedure calls Except for variations in transaction time guarantees the locations and implementations of MDARTS objects are transparent to applications MDARTS provides a C interface rather than a query language interface Our MDARTS prototype runs on VME based multiprocessors and Sun workstations and we have used MDARTS to implement a controller for an actual manufacturing machine
