Data Dissemination in Wireless Computing Environments Kian-Lee Tan, Beng Chin Ooi, 2000-06-30 In our increasingly mobile world the ability to access information on demand at any time and place can satisfy people's information needs as well as confer on them a competitive advantage The emergence of battery operated low cost and portable computers such as palmtops and PDAs coupled with the availability and exploitation of wireless networks have made possible the potential for ubiquitous computing Through the wireless networks portable equipments will become an integrated part of existing distributed computing environments and mobile users can have access to data stored at information servers located at the static portion of the network even while they are on the move Traditionally information is retrieved following a request response model However this model is no longer adequate in a wireless computing environment First the wireless channel is unreliable and the bandwidth is low compared to the wired counterpart Second the environment is essentially asymmetric with a large number of mobile users accessing a small number of servers Third battery operated portable devices can typically operate only for a short time because of the short battery lifespan Thus clients are expected to be disconnected most of the time To overcome these limitations there has been a proliferation of research efforts on designing data delivery mechanisms to support wireless computing more effectively **Data Dissemination in Wireless Computing Environments** focuses on such mechanisms The purpose is to provide a thorough and comprehensive review of recent advances on energy efficient data delivery protocols efficient wireless channel bandwidth utilization reliable broadcasting and cache invalidation strategies for clients with long disconnection time Besides surveying existing methods this book also compares and evaluates some of the more promising schemes
