Constrained Markov Decision Processes:

Constrained Markov Decision Processes Eitan Altman,1999-03-30 This book provides a unified approach for the study of constrained Markov decision processes with a finite state space and unbounded costs Unlike the single controller case considered in many other books the author considers a single controller with several objectives such as minimizing delays and loss probabilities and maximization of throughputs It is desirable to design a controller that minimizes one cost objective subject to inequality constraints on other cost objectives This framework describes dynamic decision problems arising frequently in many engineering fields A thorough overview of these applications is presented in the introduction The book is then divided into three sections that build upon each other The first part explains the theory for the finite state space The author characterizes the set of achievable expected occupation measures as well as performance vectors and identifies simple classes of policies among which optimal policies exist This allows the reduction of the original dynamic into a linear program A Lagrangian approach is then used to derive the dual linear program using dynamic programming techniques In the second part these results are extended to the infinite state space and action spaces The author provides two frameworks the case where costs are bounded below and the contracting framework The third part builds upon the results of the first two parts and examines asymptotical results of the convergence of both the value and the policies in the time horizon and in the discount factor Finally several state truncation algorithms that enable the approximation of the solution of the original control problem via finite linear programs are given

Finite Approximations in Discrete-Time Stochastic Control Naci Saldi,Tamás Linder,Serdar Yüksel,2018-05-11 In a

unified form this monograph presents fundamental results on the approximation of centralized and decentralized stochastic control problems with uncountable state measurement and action spaces It demonstrates how quantization provides a system independent and constructive method for the reduction of a system with Borel spaces to one with finite state measurement and action spaces In addition to this constructive view the book considers both the information transmission approach for discretization of actions and the computational approach for discretization of states and actions Part I of the text discusses Markov decision processes and their finite state or finite action approximations while Part II builds from there to finite approximations in decentralized stochastic control problems This volume is perfect for researchers and graduate students interested in stochastic controls With the tools presented readers will be able to establish the convergence of approximation models to original models and the methods are general enough that researchers can build corresponding approximation results typically with no additional assumptions

Optimal Control of Random Sequences in Problems with Constraints A.B. Piunovskiy,2012-12-06 Controlled stochastic processes with discrete time form a very interest ing and meaningful field of research which attracts widespread attention At the same time these processes are used for solving of many applied problems in the queueing theory in mathematical economics in the theory of controlled technical systems etc In this connection methods of the theory of controlled processes constitute the every day instrument of many specialists working in the areas mentioned The present book is devoted to the rather new area that is to the optimal control theory with functional constraints This theory is close to the theory of multicriteria optimization The compromise between the mathematical rigor and the big number of meaningful examples makes the book attractive for professional mathematicians and for specialists who ap ply mathematical methods in different specific problems Besides the book contains setting of many new interesting problems for further invf stigatioll The book can

form the basis of special courses in the theory of controlled stochastic processes for students and post graduates specializing in the applied mathematics and in the control theory of complex systems The grounding of graduating students of mathematical department is sufficient for the perfect understanding of all the material The book contains the extensive Appendix where the necessary knowledge on Borel spaces and in convex analysis is collected All the meaningful examples can be also understood by readers who are not deeply grounded in mathematics

Advances in Dynamic Games and Applications Jerzy A. Filar, Vladimir Gaitsgory, Koichi Mizukami, 2012-12-06 Modern game theory has evolved enormously since its inception in the 1920s in the works of Borel and von Neumann and since publication in the 1940s of the seminal treatise *Theory of Games and Economic Behavior* by von Neumann and Morgenstern The branch of game theory known as dynamic games is to a significant extent descended from the pioneering work on differential games done by Isaacs in the 1950s and 1960s Since those early decades game theory has branched out in many directions spanning such diverse disciplines as mathematics economics electrical and electronics engineering operations research computer science theoretical ecology environmental science and even political science The papers in this volume reflect both the maturity and the vitality of modern day game theory in general and of dynamic games in particular The maturity can be seen from the sophistication of the theorems proofs methods and numerical algorithms contained in these articles The vitality is manifested by the range of new ideas new applications the number of young researchers among the authors and the expanding worldwide coverage of research centers and institutes where the contributions originated

John Nafeh,Stanford University. Engineering-Economic Systems Department. Decision Analysis Program,1976 This work is
concerned with Markov Decision Processes with policy constraints The selection of an optimum stationary policy for such
processes in the absence of policy constraints is a problem which has received a great deal of attention and has been
satisfactorily solved Relatively little attention has been given to the case when policy constraints are present or to the
formulation of such constraints Optimum policy sensitivity analysis is also a subject in which little has been achieved Towards
those ends this work makes three major contributions First policy constraints are formulated and categorized Secondly a
computationally efficient iterative algorithm is developed for selecting the optimum policy for completely ergodic infinite
time horizon Markov Decision Processes with policy constraints for both the risk indifferent and risk sensitive cases Finally
the sensitivity of optimum policies to the policy constraints is analyzed by using the algorithm to compute the value of

Constrained Markov Decision Processes Eitan Altman,1992 Abstract We present in this paper several asymptotic properties
of constrained Markov Decision Processes MDPs with a countable state space We treat both the discounted and the expected
average cost with unbounded cost We are interested in 1 the convergence of finite horizon MDPs to the infinite horizon MDP
2 convergence of MDPs with a truncated state space to the problem with infinite state space 3 convergence of MDPs as the
discount factor goes to a limit In all these cases we establish the convergence of optimal values and policies Moreover based
on the optimal policy for the limiting problem we construct policies which are almost optimal for the other approximating
